

How to Automate System Alert and SNMP Trap Delivery

<https://campus.barracuda.com/doc/18874442/>

From the **BASIC > Administration** page, you can configure the Barracuda Load Balancer ADC to automatically email notifications to the addresses you specify. Go to the **Email Notifications** section and enter an email address in the **System Alerts Email Address** field. To enter multiple addresses, separate each address with a comma. Email notifications are generated for a variety of issues. For example, an email alert is sent when the number of operating Real Servers for a Service falls below a preset threshold.

You can also configure SNMP traps to be generated when certain events occur. Go to the **ADVANCED > SNMP Configuration** page to configure the SNMP traps on the Barracuda Load Balancer ADC. Navigate to the **SNMP Traps Events** section to specify which system events should trigger sending the corresponding SNMP trap. For example, you can send an SNMP trap when the **CPU temperature is critical** or when the **System fan has failed** by clicking the corresponding checkbox.

Be sure to click **Save Changes** when you have completed your configuration.
