

Remote Desktop Services Load Balancing

<https://campus.barracuda.com/doc/3538980/>

The Barracuda Load Balancer may be deployed with a Terminal Server farm that is using Windows Server 2003 Terminal Services, Windows Server 2008 Terminal Services or Windows Server 2008 R2 Remote Desktop Services. The Barracuda Load Balancer uses the routing token supplied by the Session Director or the TS Session Broker to determine which Real Server to use.

There are settings that need to be configured on the Real Servers to allow the Barracuda Load Balancer to use the routing tokens.
