

Services

<https://campus.barracuda.com/doc/3539063/>

A Service is a combination of a Virtual IP (VIP) address and one or more TCP/UDP ports. Traffic arriving at the designated port(s) for the specified Virtual IP address is directed to one of the Real Servers associated with that particular Service. The Barracuda Load Balancer determines which connections or requests are distributed to each Real Server based on the scheduling policy selected for the Service.
