

How to Migrate From Postini to the Barracuda Email Security Gateway

<https://campus.barracuda.com/doc/39814610/>

Barracuda Networks strongly recommends consulting with your reseller or a Barracuda sales representative prior to migration. To migrate your list of users and domains from Postini to the Barracuda Email Security Gateway:

Add Domains

1. Export your domains from Postini to a CSV file.
2. Add the domains. You can either manually add each domain or add multiple domains at one time.
 - To manually add each domain, go to the **DOMAINS > Domain Manager** page.
 - To add all of your domains at one time from the CSV file, use the Barracuda Email Security Gateway API. For more information, see the **Use Case - Adding and Configuring Multiple Domains** section in the [Barracuda Email Security Gateway API Guide](#).
3. Configure the per-domain and per-user settings for each domain. On the **DOMAINS > Domain Manager** page, click **Manage Domain** for each domain that you are configuring. The default destination server for the domains is configured in the **Server Name/IP** field on the **BASIC > IP Configuration** page.

Add Users

1. Export your list of user email accounts from Postini to a CSV file, with one address per line.
2. Add users. You can add all of your users at one time from the CSV file with either the Barracuda Email Security Gateway web interface or the Barracuda Email Security Gateway API.
 - In the Barracuda Email Security Gateway web interface, go to the **USERS > User Add/Update** page, paste the contents of your CSV file into the **User Account(s)** text box, and then click **Save Changes**.
 - If you prefer to use the Barracuda Email Security Gateway API, use the `user.create` method in a loop with a Java, Perl, or similar type of script. For details, see the [Barracuda Email Security Gateway API Guide](#).
3. On the **USERS > User Add/Update** page, configure the following settings for all of the users that you have created:
 - **Enable User(s) Quarantine** - Select **Yes** to create a quarantine account for users, or **No** to disable specified quarantine accounts. Disabled quarantine accounts will not quarantine any new messages, but any pre-existing quarantined messages will still be accessible. Any user preferences (such as Allow List/Block List) allowed to users by the

administrator will also be available.

- **Email New User(s)** – Email new account login information to users when their users accounts are created. For details, click **Help** on the **USERS > User Add/Update** page.

Managing Multiple Quarantine Inboxes with One Primary Account Users can only be added as the primary address (no aliases). To manage multiple quarantine inboxes with one *primary* account if you are using per-user quarantine, use the **Alias Linking** feature. You can enter multiple email addresses to be linked (aliased) to that primary account. Create aliases on the **ADVANCED > Explicit Users** page. For more information about the Alias Linking feature, see [Quarantine Options](#). For more details about adding and managing users, see [Creating and Managing Accounts](#).

Add Policies

To configure policies for the users and domains that you have added, go to the pages under the **BLOCK/ACCEPT** tab. To add multiple policies at one time (e.g., add multiple blocked domains), click **Bulk Edit** on these pages.
