
Monitoring and Reporting

<https://campus.barracuda.com/doc/41115802/>

The Barracuda NG Firewall offers multiple audit and reporting functionalities to help you monitor activities throughout your network.

Firewall Audit Log Streaming with IPFIX

Stream audit and reporting information based on the IPFIX protocol to external collectors by enabling IPFIX streaming for your firewall audit or HTTP proxy log.

For more information, see [How to Configure Audit & Reporting with IPFIX](#).

Box-Level Monitoring

Monitor network routes and if you are using a high availability cluster, the HA partner unit. HA units can also use an additional network connection for heartbeat communication.

For more information, see [How to Configure Box-Level Monitoring](#).

Virtual Server Monitoring

Configure monitoring policies for your virtual servers. You can define monitoring targets as IP addresses (layer 3 monitoring) and optionally interfaces (layer 2 monitoring).

For more information, see [Virtual Server Monitoring](#).

Hardware, Disk and CPU Load Monitoring

Enable hardware monitoring and specify watermark settings for disk monitoring. To monitor the CPU load of the Barracuda NG Firewall, you can limit the number of processes simultaneously waiting for execution.

For more information, see [How to Configure CPU Load, Hardware and Disk Monitoring](#).

SNMP Monitoring

SNMP allows a Network Management System (NMS) to remotely monitor the network and system state of the Barracuda NG Firewall. You can configure important events to send SNMP traps.

For more information, see [How to Configure the SNMP Service](#).

Configure Revision Control System Monitoring (RCS)

The Revision Control System (RCS) provides information on all configuration changes. You can also view, retrieve and revert older configuration versions.

For more information, see [How to Configure Revision Control System Monitoring \(RCS\)](#).

Logs

View and manage log entries for system processes and virtual servers running on the Barracuda NG Firewall.

For more information, see [Logs](#).

Statistics

The Barracuda NG Firewall generates statistic entries for each service and module. You can view statistics for disk utilization, processor load, network traffic, box and server processes.

For more information, see [Statistics](#).

Events

Events help you keep track of important system and access notifications. The Barracuda NG Firewall creates events for special system processes in the operating system, infrastructure, services, etc. You

can configure the type of notification the event sends, when triggered.

For more information, see [Events](#).

Watchdog

The Barracuda NG Firewall watchdog daemon monitors system processes and resources and executes repairs if necessary. It can also reboot the system if it detects that the system has become unresponsive or unstable.

For more information, see [Watchdog](#).

Barracuda NG Report Creator

The Barracuda NG Report Creator creates reports containing statistics and logs that are collected on Barracuda NG Firewalls, including user activities, applications and URL categories. You can also generate collective reports for multiple Barracuda NG Firewalls simultaneously.

For more information, see [How to Use the Barracuda Report Creator](#).
