## Mail Gateway Configuration

<https://campus.barracuda.com/doc/41116081/>

The following article section provides step-by-step information on how to configure the Barracuda NG Firewall mail gateway service. To enable the mail gateway service you already need to have a server installed on your Barracuda NG Firewall box. To install the Barracuda NG Firewall mail gateway service, follow the steps described in the article: [How to Configure Services](#). The mail gateway service generates three log files, which can be viewed in the **Logs** interface:

- **servicename** - This file contains the general logging data of the mail gateway service.
- **pop3** - This file belongs to the POP3 scanner and is only generated when POP3 scanning is set to enabled.
- **qspool** - This file records transactions processed between the configuration and monitoring areas of the mail gateway service and the graphical administration tool Barracuda NG Admin.
