

Configuring Client Impersonation

<https://campus.barracuda.com/doc/4259846/>

This feature is available only when the Barracuda Web Application Firewall is deployed in Proxy Mode. To use this feature, **Show Advanced Settings** must be set to **Yes** on the **ADVANCED > System Configuration** page.

To Enable Client Impersonation for a Service:

On the Server:

1. Configure the default gateway of your server to:
 1. The WAN IP address if you have a One-Arm proxy deployment.
 2. The LAN IP address if you have a Two-Arm proxy deployment.

If the units are in cluster and **Client Impersonation** is enabled, the default gateway of your server should be pointing to an additional IP address created on:

- WAN subnet on the Barracuda Web Application Firewall in One-Arm Proxy deployment, OR
- LAN subnet on the Barracuda Web Application Firewall in Two-Arm Proxy deployment.

On the web interface of the Barracuda Web Application Firewall:

1. From the **BASIC > Services** page identify the desired Service.
2. Click **Edit** next to the Server associated with that Service. The **Server (Basic Configuration)** window appears.
3. Scroll down to the **Server (Advanced Configuration)** section, and set **Client Impersonation** to **Yes**.
4. Click **Save**.
