

## PST Tuning Page

<https://campus.barracuda.com/doc/43222899/>

Use the **PST Tuning** page to configure [PST processing](#) optimization. Use the settings to throttle the PST processors that may be running concurrently in your environment and prevent PST files from overloading your Exchange and Archive servers.

Select form the available settings:

- **Cache Limit** – Allows you to limit the amount of temporary data uploaded during PST processing. If this limit is exceeded, the PST processors pause until more space becomes available.
- **Connections** – Allows you to limit the number of simultaneous PST processors made at any one time. If this limit is exceeded, the PST Processors pause for a short time and then retry until a connection can be established.
- **Timeout** – Specify the length of time before a PST file is treated as inactive after initial upload.
