

## Job Log Options

<https://campus.barracuda.com/doc/43224996/>

Yosemite Server Backup keeps a log of which files it processes while running a job. In addition to viewing the job log from the Status and Logs view, you can configure the job to e-mail it automatically to a designated e-mail address or save the log to a file for later viewing.

### Log Type

Yosemite Server Backup has several different levels of logging control to communicate what was protected in a job.

Option	Description
<b>Log only failed (default)</b>	This setting will log only files that could not be backed up because of some failure.
<b>Log only failed and not attempted</b>	This setting is log files that could not be backed up because of a failure or because the machine hosting the file was offline or because the job was cancelled.
<b>Log only completed</b>	This setting logs only the files that were successfully protected.
<b>Log all</b>	This setting will log all files the job works on. Using this setting will generate a lot of log entries and can affect the length of the backup process.
<b>None</b>	This setting is not recommended. However, using it can speed up the backup process.

### Log File Formats

Yosemite Server Backup can generate several file types. Select the log format that works best for you.

Format	Description
<b>HTML</b>	Choose this file type to save log files as fully formatted HTML files. These files can be read by most Internet browsers.
<b>XML</b>	Choose this file to save the log files as well-formed XML documents. These files can be read by most Internet browsers.
<b>Excel CSV</b>	Choose this file type to save the log files in a format that can be opened in Microsoft Excel. CSV stands for Comma Separated Value. The information saved to a file formatted for Excel CSV will display in columns and rows.
<b>Plain Text</b>	Choose this file type to save the log files in a format that can be read by any text editor.

---

## Save Log to a File

---

- **Log Format** - Choose a format from the drop down list.
- **Log will be saved to this file** - Yosemite Server Backup lets you select a file in which to store the job logs. Click the **Browse** button to select a file. Yosemite Server Backup always saves a copy of the log in the catalog in addition to the settings you choose here.

## E-mail log

---

- **Log Format** - Choose a format from the drop down list.
- **Log will be sent to** - Yosemite Server Backup lets you e-mail logs to one or more recipients. Enter a list of recipients separated by semicolons.

## Auditing

---

In some cases, you may want positive confirmation that an object—such as a database—was backed up but you do not want to wade through the log file generated by selecting **Log All**. You can accomplish this by setting the **Audit** property on the object when you select it for backup. Simply locate the object in the **Selection** page of the job properties, right-click on the object, select **Properties**, and then select the **Enable Audit** box on the property page. By default, all Exchange and SQL databases are audited.
