Sharing Storage Devices on a SAN

https://campus.barracuda.com/doc/43225102/

Backup jobs automatically select devices to use based on their availability (whether or not they are in use). In a SAN environment, Yosemite Server Backup automatically recognizes that a single backup device attached to a SAN may be accessible from two or more servers, and treats the device as a single device.

All machines that need access to a SAN server must be included in the same Yosemite Server Backup management domain.
