

## How to Create a Custom Application Object

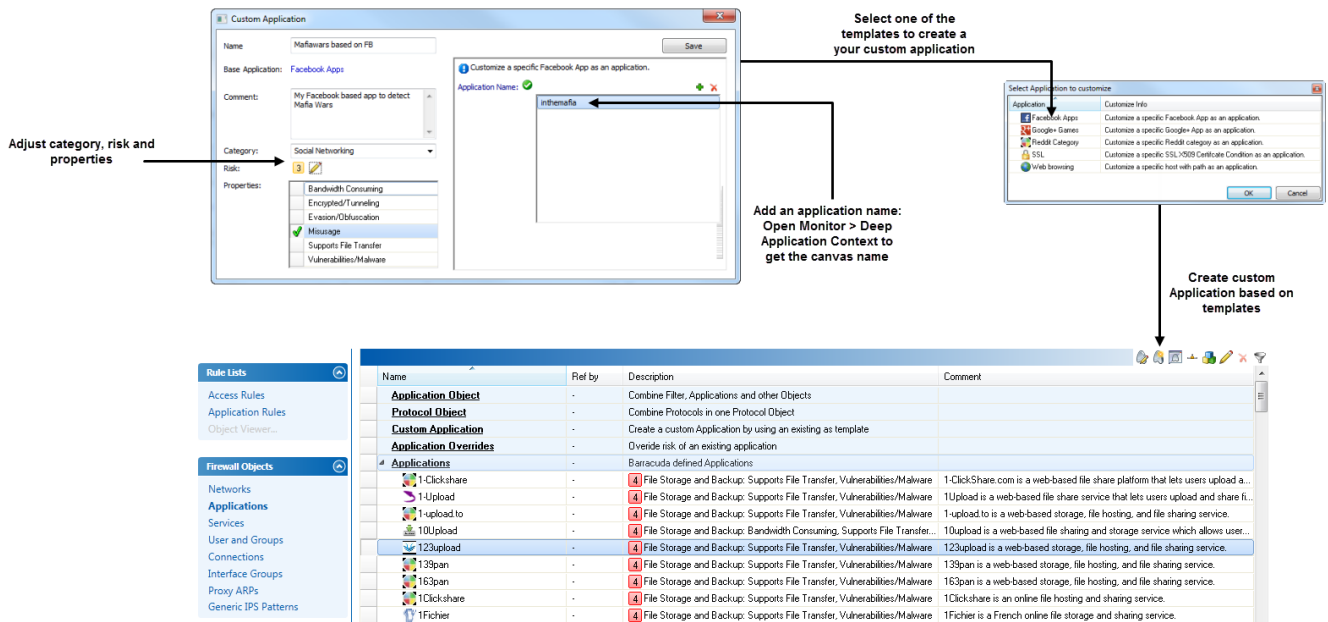

<https://campus.barracuda.com/doc/43846960/>

If the default Application Control 2.0 pattern database does not include an application that you want to use in your application rules, you can create a custom application object. Select a template for an existing application and configure it to match the application that you want to drop, throttle, prioritize, or report.

### Create a Custom Application Object

1. Go to **CONFIGURATION > Configuration Tree > Box > Virtual Servers > your virtual server > Assigned Services > Firewall > Forwarding Rules**.
2. In the left menu, expand **Firewall Objects** and select **Applications**.
3. Click **Lock**.
4. Create the custom application by either right-clicking the table and selecting **New > Custom Application** or using the icons in the top-right area of the rule set.
5. Select an application to customize and click **OK**.
6. You can customize the following settings for the application:
  - **Name** - The name of the application.
  - **Comment** - Additional information about the application.
  - **Category** - The category of the application.
  - **Risk** - The risk level of the application, from 1 (low) to 4 (high).
  - **Properties** - The properties of the application.
  - **Application Name** - If you want to customize specific components of the application, add the component names. To get the name of a component, go to the **Firewall > Monitor** page, click the application, and see the **Deep Application Control** window in the **Application Statistics** section. Examples:
    - **Facebook** - Use the canvas name of the FB application:  
`https://apps.facebook.com/<canvasname>`.
    - **SSL** - Create matching criteria based on X.509 certificate content.
    - **Web browsing** - Create matching criteria based on URL host (`www.acme.com`) or URL path (`/images?/`)
7. Click **Save**.

The following figure displays the process for creating a custom application.

**Adjust category, risk and properties**

**Select one of the templates to create a your custom application**

**Add an application name: Open Monitor > Deep Application Context to get the canvas name**

**Create custom Application based on templates**
