
Firewall Settings

<https://campus.barracuda.com/doc/43847245/>

There are several global parameters, which determine the behavior, limits and resource requirements of the Barracuda NG Firewall engine. Be aware that changing some of these parameters may require a restart of the firewall service. The firewall settings are split into two pages:

- General Firewall Configuration
- Forwarding Settings for each forwarding firewall service.

General Firewall Configuration

You can adjust sizing parameters and default behaviors for the host and forward firewall services in the general firewall configuration. Depending on your setup you may be required to increase or decrease these limits to match your needs. Use caution when changing these settings as misconfigurations may result in an insecure setup.

For more information, see [General Firewall Configuration](#).

Forwarding Firewall Setting

If you want to adjust firewall limits for just one forwarding firewall service use the forwarding firewall settings. You can set configuration parameters for bridging, VOIP, RPC handling, authentication, SOCKS forwarding and forwarding limits.

For more information, see [Forwarding Firewall Settings](#).

Firewall Sizing

To optimize your NG Firewall for large or small environments follow the recommendations right for your systems.

For more information, see [Best Practice - High Performance Environments](#) and [Best Practice - Small Barracuda NG Firewall Systems](#).
