

How to Enforce SafeSearch in the Firewall

<https://campus.barracuda.com/doc/45023913/>

You can protect users behind a Barracuda NextGen Firewall X-Series from undesired content in search results by enabling SafeSearch for the access rule handling web traffic. The necessary parameters are automatically appended to the URL when the request is forwarded by the X-Series Firewall to enforce SafeSearch. SafeSearch is supported for Google, Bing, Yahoo, and YouTube search engines.

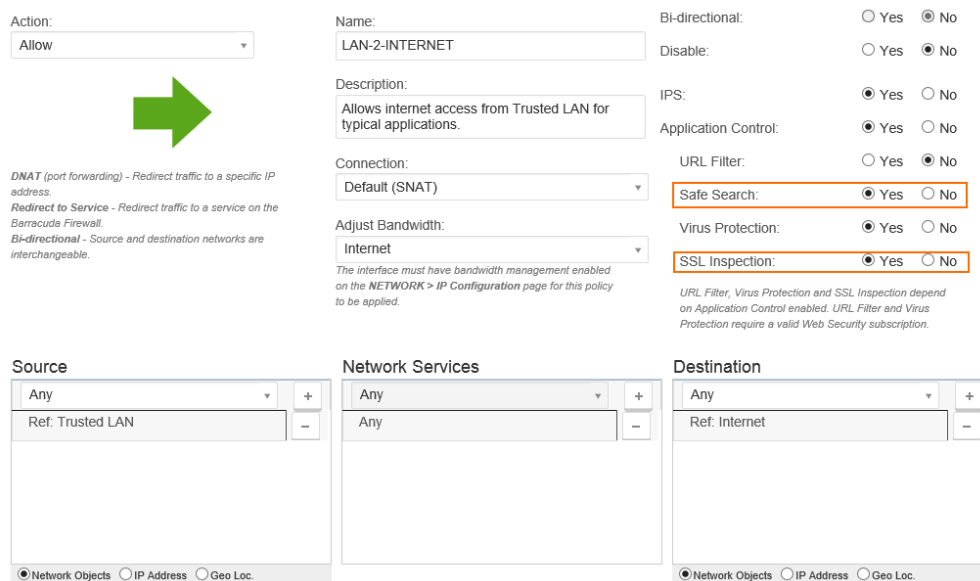

Limitations

- SafeSearch relies on the supported search engines to honor and filter the search results. The X-Series Firewall can enable this feature, but the execution is left up to the search engine.
- SafeSearch is not enforced for mobile search apps.
- SafeSearch is always set to **strict**.

Step 1: Create an Access Rule to Enforce SafeSearch

You can enforce the usage of SafeSearch for all web traffic matching an access rule by enabling the SafeSearch settings in Application Control.

1. Go to **Firewall > Firewall Rules**.
2. Under **Custom Firewall Access Rules**, click the Edit icon for the **Lan-2-Internet** rule.
3. In the **General** tab, set **SafeSearch** and **SSL Inspection** to **Yes**.

The screenshot shows the 'General' tab of the 'Lan-2-Internet' rule configuration. The 'Action' is set to 'Allow'. The 'Name' is 'LAN-2-INTERNET'. The 'Description' is 'Allows internet access from Trusted LAN for typical applications.' The 'Connection' is 'Default (SNAT)'. The 'Adjust Bandwidth' is 'Internet'. The 'Bi-directional' checkbox is checked. The 'Disable' checkbox is unchecked. The 'IPS' checkbox is checked. The 'Application Control' checkbox is checked. The 'URL Filter' checkbox is checked. The 'Safe Search' checkbox is checked. The 'Virus Protection' checkbox is checked. The 'SSL Inspection' checkbox is checked. The 'Source' is 'Any' (Ref: Trusted LAN). The 'Network Services' is 'Any'. The 'Destination' is 'Any' (Ref: Internet). The 'Safe Search' and 'SSL Inspection' settings are highlighted with orange boxes.

4. Click **Save**.

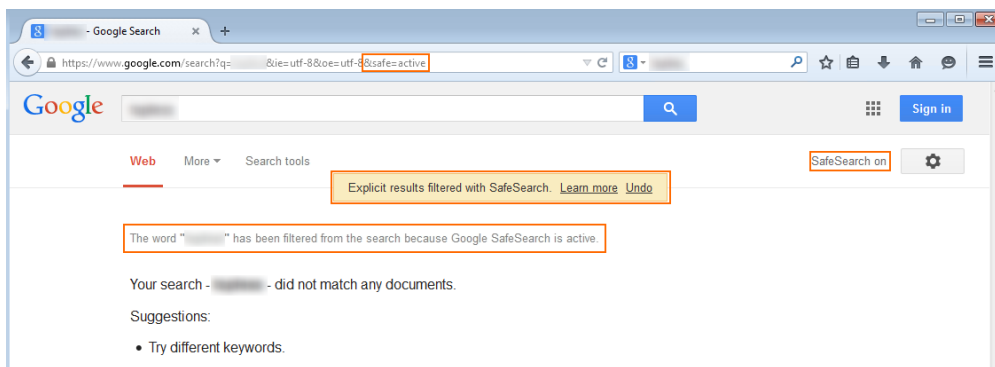

Every search query handled by this access rule now automatically enforces the SafeSearch feature of

the search engine provider.

Step 2: Verify SafeSearch is Working

You can test if your search engine is using SafeSearch by looking at the URL after a search query. Each search engine includes a specific URL parameter that indicates SafeSearch is on.

SafeSearch for Google includes the string **safe=active** in the URL. In addition, Google also includes messages on the web page stating that SafeSearch is on or active.

SafeSearch for Bing includes the string **adlt=strict** in the URL.

SafeSearch for Yahoo includes the string **vm=r** in the URL.

YouTube handles SafeSearch through setting a parameter in a cookie. That means you will not see a specific SafeSearch string in the URL.
