

How to Override the Risk Classification of an Application

Every application pattern delivered with the Application Control database of a NextGen F-Series Firewall contains a risk classification. The risk classification extends the category of each application to allow an even more granular classification of single applications. Depending on the common usage and reputation, the risk classification may vary from 1 (low risk) to 4 (high risk).

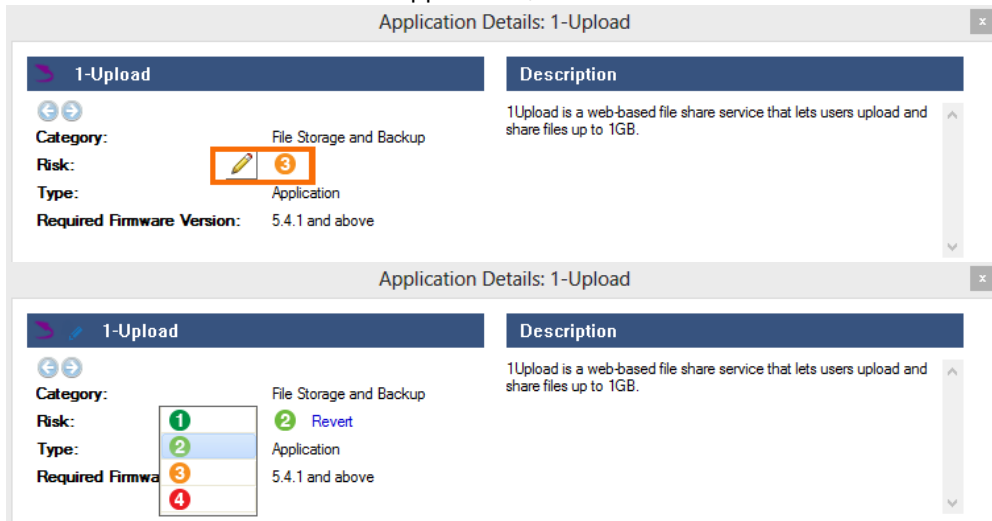

Barracuda Networks continuously observes web application reputations and keeps you up-to-date on the latest risk classifications. However, in some cases it may be necessary to manually override risk classification.

Override the Risk Level of an Application

1. Go to **CONFIGURATION > Configuration Tree > Box > Virtual Servers > your virtual server > Assigned Services > Firewall > Forwarding Rules.**
2. Click **Lock**.
3. In the left menu, expand **Firewall Objects** and click **Applications**.
4. Change the risk level of an application by either right-clicking it and selecting **Override this Application** or by using the icons in the top-right area of the ruleset.

5. Select the new risk level for the application, and click **OK**.

6. Click **Send Changes** and **Activate**.

The risk classification of the application in the list is now changed to the new value.
