

How to Configure Source-Based Routes

<https://campus.barracuda.com/doc/46209093/>

Source-based routing, often referred to as policy routing, is used when the source IP address of the connection determines, in part or completely, which route is used. Source-based routing can be used to ensure that traffic is sent via a specific connection. For each source-based routing entry, a routing table for that specific IP address/network is created and consulted when traffic from that network comes in.

Step 1. Create a Source-Based Route

1. Go to **CONFIGURATION > Configuration Tree > Box > Network**.
2. In the left menu, click **Routing**.
3. Click **Lock**.
4. In the **Source Based Routing** section, add or edit an entry for your route in the **Routing Rules** table:
 1. **Name** - Enter a **name**. E.g., route1
 2. **Source Networks** - Add the source IP address or network. E.g., 10.0.10.0/24
 3. **Routes** - Click + to add a route table entry for the source network.
 - **Target Network Address** - Enter the target network IP address. E.g., 0.0.0.0/0
 - **Route Type** - Select **unicast**, **multipath** or **throw**. If throw is selected, the route lookup will end once the first matching route is found.
 - **Gateway (only for unicast routes)** - Enter the IP address of the remote gateway.
 - **Multipath Gateway (only for multicast routes)** - Enter the **Multipath Gateway** and **Weight Number** (Metric) for each route.
 - **Packet Load Balancing (only for multicast routes)** - If needed, enable packet load balancing.
 - **Route Metric (only for unicast routes)** - Enter the route metric for the gateway route.
 - **Advertise Route** - Select **YES** if you want to use dynamic routing service. For more information, see [Dynamic Routing Protocols \(OSPF/RIP/BGP\)](#).
5. Select where the route table is placed, before (**premain**) or after (**postmain**) the main routing table.
6. Click **OK**.
7. Click **Send Changes** and **Activate**.

Step 2. Activate the New Network Configuration

After you have configured the network route, you must execute your new network configurations.

1. Go to **CONTROL > Box**.
2. In the left navigation pane, expand **Network** and then click **Activate new network configuration**.
3. Select **Failsafe**. The **Failsafe Activation Succeeded** message is displayed after your new network configurations have been successfully activated.
4. Click **OK**.
