

How to Configure a Client-to-Site TINA VPN with Personal Licenses

<https://campus.barracuda.com/doc/46209146/>

To let mobile workers securely connect to corporate resources, you can configure a client-to-site TINA VPN. Follow the steps in this article to configure a client-to-site VPN with the built-in Barracuda CA (lic files). To connect to this type of VPN, clients require the Barracuda VPN Client, an optionally password-protected certificate license file, and a server password. To enable multiple concurrent client-to-site sessions per user, a premium remote access subscription is required.

In this article:

Before You Begin

- Verify that the VPN service has been properly configured and that all necessary certificates are installed. For more information on how to create a service, see [How to Configure Services](#).
- If you are deploying a routed (static route) client-to-site VPN, identify the subnet and gateway for the VPN clients in your network.
- If you are deploying a local (proxy ARP) client-to-site VPN, identify the subnet of the home network to be used for the VPN clients.
- To enable multiple simultaneous client-to-site connections by the same user, a premium remote access subscription is required. For more information, see [Licensing](#)

Step 1. Configure the Service and Default Server Certificates

1. Go to **CONFIGURATION > Configuration Tree > Box > Virtual Servers > your virtual server > Assigned Services > VPN-Service > VPN Settings**.

2. Click **Lock**.
3. Click **Click here for Server Settings**.
4. Verify that the **Default Server Certificate** and **Default Key** are both valid (green). If the **Default Server Certificate** and **Default Key** are not valid, see [How to Set Up VPN Certificates](#).
5. Click **OK**.
6. Click on the **Service Certificates/Keys** tab.
7. Right-click the table, and select **New Key**.
8. Enter the **Key Name**.
9. Select the **Key Length**.
10. Click **OK**.
11. Click **Send Changes** and **Activate**.

Step 2. Configure the VPN Client Network

1. Go to **CONFIGURATION > Configuration Tree > Box > Virtual Servers > your virtual server > Assigned Services > VPN-Service > VPN Settings**.
2. Click **Lock**.
3. Click the **Client Networks** tab.
4. Right-click the table, and select **New Client Network**.
5. In the **Client Network** window, configure the following settings:
 1. **Name** - Enter a descriptive name for the network, e.g.: Client to Site VPN Network
 2. **Network Address** - Enter the default network address, e.g.: 192.168.6.0. All VPN clients will receive an IP address in this network.
 3. **Network Mask** - Specify the appropriate subnet mask, e.g.: 24
 4. **Gateway** - Enter the gateway network address, e.g.: 192.168.6.254**Type** - Select the type of network that is used for VPN clients:
 - **routed (Static Route)** - A separate subnet. A static route on the Barracuda NextGen Firewall F-Series routes traffic between the VPN client subnet and the local network.
 - **local (proxy ARP)** - A subnet of a local network. For example, Local network: 10.0.0.0/24, Local segment 10.0.0.128/28. You must also specify the IP range for the network:
 - **IP Range Base** - Enter the first IP address in the IP range for the VPN client subnet, e.g.: 10.0.0.128.
 - **IP Range Mask** - Specify the subnet mask of the VPN client subnet, e.g. 28
6. Click **OK**.
7. Click **Send Changes** and **Activate**.

Step 3. Create a Barracuda VPN CA Template

1. Go to **CONFIGURATION > Configuration Tree > Box > Virtual Servers > your virtual server > Assigned Services > VPN-Service > Client to Site**.
2. Click **Lock**.
3. Click the **Barracuda VPN CA** tab, and then click the **Templates** tab under it.
4. Right-click the table, and select **New Template**.
5. In the **Barracuda Templates** window, configure the following settings:
 - **Name** - Enter a descriptive name for the template, e.g.: VPNTemplate
 - **DNS** - (Optional) Enter the IP address of the DNS server.
 - **WINS** - (Optional) Enter the IP address of the WINS server.
 - **Network Routes** - Add the routes to the local network. Enter the IP address, e.g.: 10.0.0.0/24 and click **Add** to add the entry.
 - **Accepted Ciphers** - Select the encryption algorithms that the VPN server will offer.
Recommended settings:
 - **AES** for licensed systems.
 - **DES** for export restricted systems.
6. Click **OK** to save the template.
7. Click **Send Changes** and **Activate**.

Step 4. Add a Personal License

1. Go to **CONFIGURATION > Configuration Tree > Box > Virtual Servers > your virtual server > Assigned Services > VPN-Service > Client to Site**.
2. Click **Lock**.
3. Click the **Barracuda VPN CA** tab and then click the **Pool Licenses** tab under it.
4. In the upper table, select your **VPN Pool Licenses**.
5. Right-click the lower table, and select **New personal license**.
6. Select an index number for the new license, and then click **OK**. The **Personal License** window opens.
7. In the **Used by** field, enter the name of the user. E.g., Test User
8. Enter the **IP Address & Networking** settings:
 - **Network** - Select the VPN client network configured in step 1.
 - **(optional) Template** - Select a Barracuda VPN CA Template.
 - **(Windows NAC client only) ENA** - Select to prevent clients from accessing any other than the published VPN network.
9. Configure authentication service in the **Password and Peer Restriction** section:
 - Select **local** to use a server password to log in. Click **Change Server Password** to set a server password.
 - For external authentication servers, select the scheme, and enter the **User ID** user name. The user must enter the password associated with this user when logging in. For more information, see [Authentication](#).
10. Click on the **Active Certificate** tab.
11. Select the server certificate from the **Certificate** list. E.g., **ServerCertificate**.

12. Verify that the **Certificate** and **User Key** are listed as **Valid**.
13. Click **Export to File** to export the license file. This file will be distributed to clients to authenticate when connecting to the VPN.

14. (optional) Enter a password to protect the file, and click **OK**, or click **No Password**.

15. Click **Send Changes** and **Activate**.

In the **Status** column next to the new personal license, a green check mark indicates that the license file can now be used on a client to connect to the VPN.

Status	Idx	Type	Person	IP	ENA	VPNNet	ServerKey	Template	Key Hash	License
 Active	001		testuser	192.168.3.1+dyn	No	VPNClient	TestService	Test	YNCQKQ	barracadavpn-99-1

Step 5. Add Access Rules

Add two access rules to connect your client-to-site VPN to your network. For instructions, see [How to Configure an Access Rule for a Client-to-Site VPN](#).

Monitoring VPN Connections

On the **VPN > Client-to-Site** page, you can monitor VPN connections.

DASHBOARD CONFIGURATION CONTROL FIREWALL NAC VPN MAILGW DHCP PROXY LOGS STATISTICS EVENTS											
Site-to-Site		Client-to-Site		Status		Selection		Filter		NAC:1 (9999) - Clients:0 (9999) - SSL: 0	
Name	Tunnel	Type	Group	Info	State	Succ.	Fail	Last Access	Last Peer	Last Info	
 PERS	99-1			SM:testuser	ACTIVE	5	4	9s	10.70.0.10	Access Granted...	
 PERS	99-2			SM:testuser	Ready	0	0				

The page lists all available client-to-site VPN tunnels. In the **Tunnel** column, the color of the square indicates the status of the VPN:

- **Blue** - The client is currently connected.
- **Green** - The VPN tunnel is available, but currently not in use.
- **Grey** - The VPN tunnel is currently disabled. To enable the tunnel, right-click it and select **Enable Tunnel**.

For more information about the **VPN > Client-to-Site** page, see [VPN Tab](#).

VPN Log File

The VPN service uses the `/yourVirtualServer/VPN/VPN` log file.
