

Shared Services

<https://campus.barracuda.com/doc/46209510/>

Shared services are services designed to run on multiple NextGen F-Series Firewalls.

For more information, see [How to Configure a Shared Service](#).

Distributed Firewall

The distributed firewall (formerly Cascaded Firewall or cfirewall) is a firewall service distributed across multiple firewalls. It is a variant of the regular firewall service, designed to simplify firewall administration by multiple administrators. The distributed firewall is a shared service and replaces the standalone firewall service. You cannot run a distributed firewall service and a standalone firewall service together on a virtual server.

For more information, see [Distributed Firewall](#).

Shared DNS Server

The DNS service can also be used as a shared service distributed across multiple firewalls. Configure the shared DNS service like the standard DNS service.

For more information, see [DNS](#).
