User Objects

https://campus.barracuda.com/doc/46895702/

The **Users** view allows you to view and configure user objects. User objects restrict access rules to specific users and user groups. When creating a user object, you can include (reference to) other user objects that are already configured. A user object is also automatically created whenever a connection attempt is processed by the firewall. The object is then inserted into the corresponding rule.
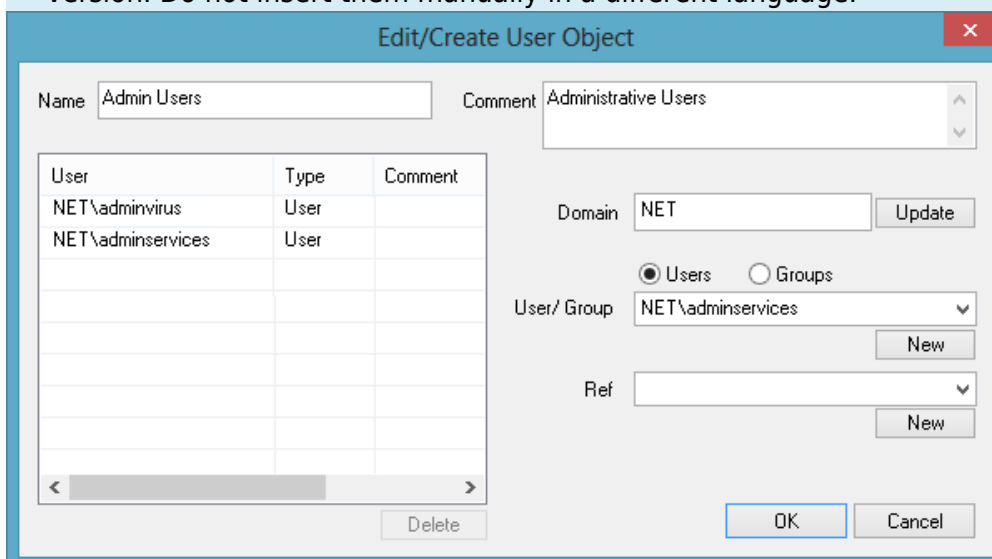

Create a User Object

1. Select **New** in the bottom bar or from the context menu in the **User Objects** window.
2. Specify a **Name** for the user object.
3. Optionally, insert a **Description**.
4. In the **User/Group** list, select your users / groups and click **New** to add them to the **User** list. In this list, the Microsoft Windows domain users and groups known to the Barracuda Personal Firewall are available for selection. If the Windows workstation is a member of a Windows domain, the domain user and group information can be retrieved from the Active Directory server by clicking **Update**.
   Irrespective of the operating system's active language on the workstation, the following users will always be displayed in English:
   - NT AUTHORITY\SYSTEM
   - NT AUTHORITY\LOCAL SERVICE
   - NT AUTHORITY\NETWORK SERVICE
   - NT AUTHORITY\NETWORK

   The internal firewall engine will transform these names to the appropriate language version. Do not insert them manually in a different language.

If applicable, specify a reference to the user object. Click **New** after each selection.

5. Click **OK**.

To save configuration changes made on the Barracuda CloudGen Firewall, click **Send Changes** and **Activate**. To save configuration changes made on the Barracuda Personal Firewall, use the option provided on the page, or click the **Alt** key, expand the **Firewall** menu, and select **Save Configuration**.
