

FSC Deployment via VPN Deployment Mode

If you do not have physical access to the Secure Connector, you can configure the FSC to connect to the FSAC and Control Center by using a passphrase-authenticated VPN tunnel in VPN deployment mode. After the connection is established, the Control Center pushes the configuration to the FSC. Now that the FSC has the necessary certificates, the VPN tunnel is automatically switched to operational mode.

Before You begin

Configure the FSAC and Control Center. For more information, see [Secure Access Concentrator and Control Center Deployment](#).

Limitations

An FSC using templates where the VPN mode is set to **Operative** cannot be switched to **Deployment Mode**. Exempt the VPN Mode setting from the template, or use a special VPN deployment template. Move the FSC to the production template after it connects successfully.

Step 1. Configure the FSC on the Control Center

Configure the FSC using the Secure Connector Editor. Configure the VPN in deployment mode. The configuration must be saved for the automatically filled information (blue background) to be visible.

For more information, see [How to Add a Secure Connector Configuration](#).

Step 2. Get required information from the FSC configuration

The following information from the FSC configuration is necessary to configure the FSC via web interface.

1. Go to **your cluster > Cluster Settings > Secure Connector Editor**.
2. Double-click on the FSC configuration.
3. The following web UI settings must be filled with the values of their corresponding Secure Connector Editor settings:
 - **Box Unique Identifier** - In the FSC configuration, go to **Identification Settings > Unique Identifier**.
 - **Virtual IP** - In the FSC configuration, go to **VPN Settings > Virtual IP**.
 - **Entry Point Address** - In the FSC configuration, go to **VPN Settings > Server Name or Address**.
 - **Entry Point Port** - In the FSC configuration, go to **VPN Settings > Server Port**.
 - **Tunnel Mode** - In the FSC configuration, go to **VPN Settings > Tunnel Mode**.
 - **Encryption** - In the FSC configuration, go to **VPN Settings > Encryption**.

Step 3. Enable VPN deployment mode for the FSC

Enable VPN deployment mode for the FSC. If you are not using a template and the VPN mode is already set to **Deployment Mode** you can skip this step.

1. Go to **your cluster > Cluster Settings > Secure Connector Editor**.
2. Click **Lock**.
3. In the **SC List**, right-click the FSC and select **Set VPN Mode**.

CONTROL CONFIGURATION DATABASE ADMINS STATISTICS EVENTS NAC

Set VPN mode
Move To Template

4. From the **Operative Mode** drop-down list, select **Deployment Mode**.
5. Enter the **Deployment** passphrase.
6. Click **OK**.
7. Click **Activate**.

Step 4. Configure the FSC to connect to the FSAC

The FSC listens on 192.168.200.200 on the LAN port. You must configure your client PC to connect to the FSC and then use the web interface to configure the WAN and VPN connection.

1. Change your client PC IP address to:
 - o **IP address** - 192.168.200.100
 - o **Netmask** - 255.255.255.0
 - o **Gateway** - 192.168.200.200
2. Connect your client PC to the **LAN** port of the FSC.
3. Open a browser and go to <https://192.168.200.200>.
4. Log into the Secure Connector:
 - o **Username** - Enter admin.
 - o **Password** - Enter admin.
5. Click **Sign In**.
6. Click **Retrieve Lock**.
7. Go to **CONFIGURATION > Network**.
8. Configure the WAN connection. For more information, see [FSC WAN Connections](#).
9. Go to **CONFIGURATION > VPN**.
10. Configure the VPN:
 - o **Enabled** - Select **Enabled**.
 - o **Box Unique Identifier** - Enter the **Unique Identifier** from the FSC configuration.
 - o **Sever Mode** - Select **Deployment Mode**.
 - o **Deployment Password** - Enter the deployment passphrase set in Step 3.
 - o **Virtual IP** - Enter the Virtual IP address assigned to the FSC by the Control Center.
 - o **Entry Point Address** - Enter the public IP address through which the FSAC can be reached.
 - o **Entry Point Port** - Enter the port on the border firewall that forwards the FSC VPN traffic to the FSAC.
 - o **Tunnel Mode** - Select the tunnel mode set in the FSC configuration.
 - o **Encryption** - Select the encryption set in the FSC configuration.

VPN CONFIG		Save Changes
Enabled	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled	
Box Unique Identifier	<input type="text" value="3-S-SeriesCluster-SC3"/>	
Server Mode	<input type="radio"/> Operative-Mode <input checked="" type="radio"/> Deployment-Mode	
Deployment Password	<input type="text" value="thisisyourpassword"/>	
Virtual IP	<input type="text" value="10.33.0.97"/>	
Entry Point Address	<input type="text" value=""/>	
Entry Point Port	<input type="text" value="692"/>	
Tunnel Mode	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	
Encryption	<input type="text" value="AES"/>	

11. Click **Save Changes**.
12. Click **Activate Configs**.

The FSC now automatically connects to the FSAC and automatically receives the configuration from the Control Center. Any existing configuration locks are overridden by the Control Center. As the FSC applies the configuration, the VPN connection is terminated and reestablished in operational mode using certificate authentication. Existing configuration locks on the FSC are overridden during this process.
