

How to Configure Virus Scanning in the Firewall for FTP Traffic

<https://campus.barracuda.com/doc/48660787/>

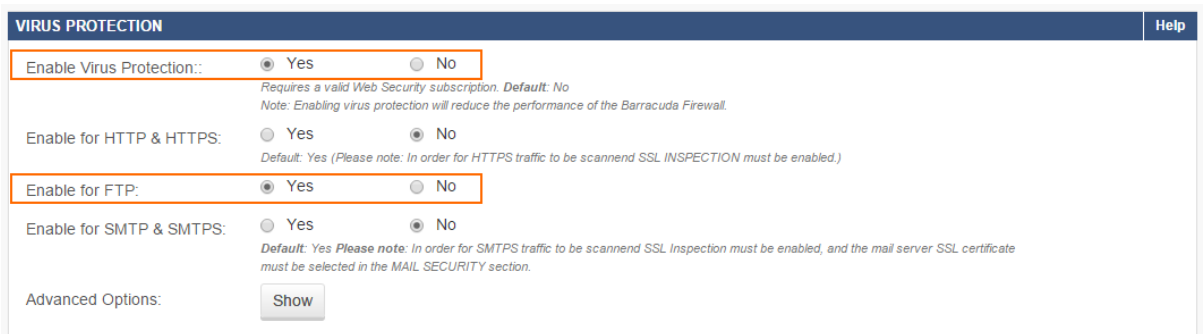

The X-Series Firewall scans FTP traffic for malware on a per-access-rule basis when FTP virus scanning in the firewall is enabled. Both active and passive FTP is supported; SSL-encrypted FTP is not supported. Depending on the access rule, you can either protect your FTP server from uploads containing malware, or scan files downloaded from external FTP servers. Since the FTP protocol does not contain any MIME-type information, all files are scanned regardless of the MIME-type list configured for the virus scanner. When an FTP download is initiated, the FTP client creates a local, zero-byte file. Normally, the transferred data would be written to this file until the download is finished. However, if the file is determined to be malware, the connection is terminated immediately, leaving the zero-byte file or file fragment (if data trickling is enabled) on the client. Depending on the FTP client, it may attempt to download the file multiple times; each time the connection will be reset by the firewall.

Step 1. Enable Virus Protection for FTP

Enable support for virus scanning FTP connections in the firewall.

1. Go to the **FIREWALL > Settings** page.
2. Make sure that **Application Control** is enabled.
3. In the **Virus Protection** section,
 1. Set **Enable Virus Protection** to **Yes**.
 2. Set **Enable for FTP** to **Yes**.

4. (optional) Click **Show** to configure **Advanced Options**:

Changing settings for the virus scanner also affects virus scanning for other services.

1. Change the default behavior **If Virus Scanner is not available**.
 - **Block All** - (default) Block all files.
 - **Allow All** - All files will be allowed.
2. Configure the following settings:
 - **Block Large Files / Large File Limit** - To block files that exceed the **Large File Limit**, enable **Block Large Files**. The large file policy is set to a sensible value for your appliance. The maximum value is 1024 MB. If disabled, large files will not be scanned. Instead, they will be delivered directly to the client.
 - **Data Trickling** - Change how fast and how much data is transmitted. Change these settings if your FTP client times out while waiting for the file to be scanned.
3. Click **Save**.
5. Click **Save**.

Step 2. Create an access rule for FTP client downloads

To scan files downloaded from external FTP servers, create a matching access rule and enable Application Control and Virus Protection.

1. Go to **FIREWALL > Firewall Rules**.
2. Create an access rule with the following settings:
 - **Action** - Select **Allow**.
 - **Connection** - Select **Dynamic SNAT**.
 - **Source** - Select **Trusted LAN**, and click +.
 - **Network Services** - Select **FTP**, and click +.
 - **Destination** - Select **Internet**, and click +.
3. Enable **Application Control** and **Virus Protection**.

Add Access Rule ?

General
Advanced

Action: Allow

DNAT (port forwarding) - Redirect traffic to a specific IP address.
Redirect to Service - Redirect traffic to a service on the Barracuda Firewall.
Bi-directional - Source and destination networks are interchangeable.

Name: Virscan-External-FTP

Description: scan files downloaded from external FTP servers

Connection: Dynamic SNAT

Adjust Bandwidth: Internet

The interface must have bandwidth management enabled on the NETWORK > IP Configuration page for this policy to be applied.

Bi-directional: Yes No

Disable: Yes No

IPS: Yes No

Application Control: Yes No

SSL Inspection: Yes No

URL Filter: Yes No

Virus Protection: Yes No

4. Click **Save**.

Step 3. (optional) Create a DNAT access rule to protect an internal FTP server

To protect an internal FTP server from receiving infected files, create a matching DNAT access rule, and enable Application Control and Virus Protection.

1. Go to **FIREWALL > Firewall Rules**.
2. Create an access rule with the following settings:
 - **Action** - Select **DNAT**.
 - **Connection** - Select **No SNAT**.
 - **Source** - Select **Internet**, and click **+**.
 - **Network Services** - Select **FTP**, and click **+**.
 - **Destination** - Enter the public IP address or FQDN used for your FTP server, and click **+**.
 - **Redirect** - Enter the IP address(es) of your internal FTP server(s), and click **+**.
3. Enable **Application Control** and **Virus Protection**.

Monitoring and testing

You can test the virus scanner setup by downloading EICAR test files from an FTP server. Files that are malware are not downloaded. 0-byte stub files are created by the FTP client.

To monitor detected viruses and malware, go to the **BASIC > Recent Threats** page.

Action	Severity (IPS)	Info	Last	Count	Firewall Rule	URL Category	Source IP	Destination IP	Protocol	Service	UserID	Type	Reference	Category
Add Exception	●	VIRUS Eicar test string	3w 3d 20h 31m 23s	37	LAN-2-INTERNET		10.0.10.9	188.40.238.250	TCP	80		IPS		Virus/Worm
