

Example - Client-to-Site TINA VPN with Client Certificate Authentication

<https://campus.barracuda.com/doc/50660241/>

Use a Client-to-Site VPN to let mobile workers connect securely to your Barracuda NextGen Firewall F-Series. Each client must have a valid client certificate as well as the username and password to authenticate. The client must use the Barracuda VPN Client or CudaLaunch on Android to connect to the Barracuda NextGen Firewall F-Series via the TINA VPN protocol. By default, each user can have only one concurrent client-to-site VPN connection. A Remote Access Premium subscription is required to enable concurrent Client-to-Site VPN sessions by the same user. You can connect from any IPv4 or IPv6 address, as long as an external IPv4 and IPv6 address are configured as a service IP address for the VPN service. Traffic passing through the Client-to-Site VPN is limited to IPv4.

Supported VPN clients

The following client is supported for this client-to-site configuration:

- [CudaLaunch for Android](#) via VPN Templates in SSL VPN. For more information, see [How to Configure VPN Group Policies in the SSL VPN](#).
- [VPN Client & Network Access Client](#)

Before you begin

- Set up the VPN certificates for External CA. For more information, see [How to Set Up External CA VPN Certificates](#).
- Configure an external or local authentication service. For more information, see [Authentication](#).
- Identify the subnet and gateway address to use for the VPN service in your network (e.g., 192.168.6.0/24 and 192.168.6.254).
- Identify the IPv4 and IPv6 addresses the VPN service is listening on. If you are using a dynamic WAN IP, see [How to Configure VPN Access via a Dynamic WAN IP Address](#).

Step 1. Configure the VPN service listeners

Configure the IPv4 and IPv6 listener addresses for the VPN service.

1. Go to **CONFIGURATION > Configuration Tree > Box > Virtual Server > your virtual server > Assigned Services > VPN > Service Properties**.
2. Click **Lock**.
3. From the **Service Availability** list, select the source for the IPv4 listeners:
 - **First+Second-IP** – The VPN service listens on the first and second virtual server IPv4 address.
 - **First-IP** – The VPN service listens on the first virtual server IPv4 address.
 - **Second-IP** – The VPN service listens on the second virtual server IPv4 address.
 - **Explicit** – For each IP address, click + and enter the IPv4 Addresses in the **Explicit Service IPs** list.
4. Click + to add an entry to the **Explicit IPv6 Service IPs**.
5. Select an IPv6 listener from the list of configured explicit IPv6 virtual server IP addresses.

6. Click **Send Changes** and **Activate**.

Step 2. Create the VPN client network

All VPN clients will receive an IP address from the VPN client network with a static gateway. You can choose the gateway IP address freely from the subnet.

1. Go to **CONFIGURATION > Configuration Tree > Box > Virtual Servers > your virtual server > Assigned Services > VPN-Service > VPN Settings**.
2. Click **Lock**.
3. Verify that the default server certificate and key are valid.
 1. Right-click the **Settings** table and select **Edit Server Settings**.

- Verify that the **Default Server Certificate** and **Default Key** are both valid (green). If the **Default Server Certificate** and **Default Key** are not valid, see [How to Set Up Barracuda VPN CA VPN Certificates](#).

Default Server Certificate	
Subject	C=AT,O=Barracuda Networks,CN=Documentation,ST=TIROL,L=Innsbruck
Issuer	Self Signed.
	Valid (HKZECO) Ex/Import ▼
<hr/>	
Default Key	Valid (HKZECO) Ex/Import ▼

- Click **OK** to close the **Server Settings** window.
- Configure the client network.
 - Click the **Client Networks** tab.
 - Right-click the table and select **New Client Network**. The **Client Network** window opens.
 - In the **Client Network** window, configure the following settings:
 - **Name** - Enter a descriptive name for the network.
 - **Network Address** - Enter the base network address for the VPN clients. E.g., 192.168.6.0
 - **Network Mask** - Enter the subnet mask for the VPN client network. E.g., 24
 - **Gateway** - Enter the gateway network address. E.g., 192.168.6.254
 - **Type** - Select **routed (Static Route)**. VPN clients are assigned an address via DHCP (fixed or dynamic) in a separate network reserved for the VPN. A static route on the Barracuda NextGen Firewall F-Series leads to the local network.

Network Mask 24 = 255.255.255.0

Gateway

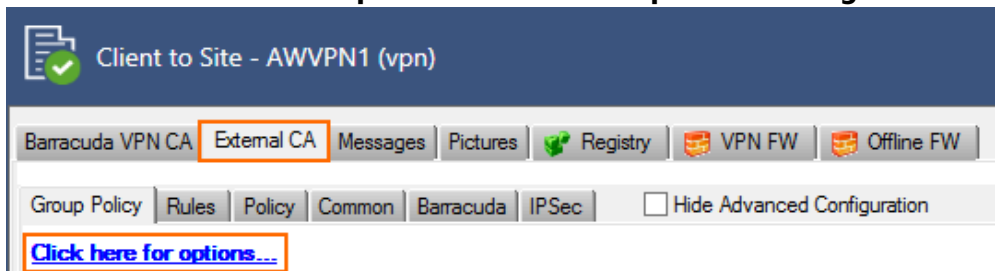

Type

- Click **OK**.
- Upload the root certificate:
 - Click the **Root Certificates** tab.
 - Right-click the table and select **Import CER from File** or **Import PEM from File**. The **Root Certificate** window opens.
 - Enter the **Name** for the root certificate.
 - In the **Usage** section, select **Barracuda Personal**.

5. (optional) Click on the **Certificate revocation** tab to configure a CRL host.
6. (optional) Click on the **OCSP** tab to configure an OCSP server. For more information, see [How to Configure OCSP Validation](#).
7. Click **OK**.
7. Upload the service certificate:
 1. Click the **Service Certificates/Keys** tab.
 2. Right-click the table and select **Import from File**.
 3. Enter a **Name**.
 4. Click **OK**.
8. Click **Send Changes** and **Activate**.

Step 3. Configure VPN group match settings

1. Go to **CONFIGURATION > Configuration Tree > Box > Virtual Servers > your virtual server > Assigned Services > VPN-Service > Client to Site**.
2. Click **Lock**.
3. Click the **External CA** tab.
4. Click the **Click here for options** link. The **Group VPN Settings** window opens.

5. In the **Group VPN Settings** window, configure the following settings:
 1. In the **X509 Client Security** section, select **X509 Certificate**. This will force all users connecting to this NextGen Firewall F-Series, regardless of the Group Policy, to use client certificate authentication.

Selecting mandatory client credentials forces all group policies configured on the NextGen Firewall F-Series to comply to these client security settings. If in doubt, leave these settings unchecked.
 2. In the **Server** section, select your previously configured authentication service from the **Authentication Scheme** list. For more information, see [Authentication](#).
 3. (optional) To allow only one root certificate to be used for all Group Policies on this NextGen Firewall F-Series, select the certificate from the **Used Root Certificates** list.
 4. Select which X509 certificate field is to be verified by the **Authentication Scheme** selected above. Typically, this is the **emailAddress**, or username in the **Subject**.

6. Click **OK**.
7. Click **Send Changes** and **Activate**.

Step 4. Create a VPN group policy

The VPN Group Policy specifies the network IPsec settings and defines the conditions to be met by the client certificate.

1. Go to **CONFIGURATION > Configuration Tree > Box > Virtual Servers > your virtual server > Assigned Services > VPN-Service > Client to Site**.
2. Click **Lock**.
3. Click on the **External CA** tab and then click the **Group Policy** tab.
4. Right-click the table and select **New Group Policy**. The **Edit Group Policy** window opens.
5. Enter a name for the **Group Policy**.
6. From the **Network** list, select the VPN client network.
7. In the **Network Routes** table, enter the network that must be reachable through the VPN connection. For example, 10.10.200.0/24.

To route all traffic through the Client-to-Site VPN tunnel, add a 0.0.0.0/0 network route.

Name: C2S-GroupPolicy Disabled

Group Policy Condition

External Group	Client	X509 Subject	Cert Policy / OID	Peer

8. Configure the group policy conditions. Only clients matching these conditions are allowed to connect through this group policy.
 1. Right-click the **Group Policy Condition** table and select **New Rule**. The **Group Policy Condition** window opens.
 2. (optional) In the **Group Pattern** field, define the groups on the authentication server that will be assigned the policy. E.g.: CN=vpnusers*
 3. In the **X509 Certificate Conditions** section click **Edit/Show**. The **Certificate Condition** window opens.
 1. For each certificate condition, select the certificate field from the dropdown and enter the required value and click **Add/Change**.

Key	Pattern
altNa...	*smard.test*

altName (Alternative Name) *smard.test* Add/Change

Please Note: Delete

2. Click **OK**.
4. (optional) Enter an OID in the **Certificate Policy** to allow only certificates with a specific **Key Usage**. E.g. Client Authentication (1.3.6.1.5.5.7.3.2)
5. In the **Peer Condition** section, verify that **Barracuda Client** checkbox is selected.
6. In the **X509 Certificate Conditions** section, enter matching conditions for the X509 client certificates.
9. Click **OK**.

10. Click **OK**.
11. Click **Send Changes** and **Activate**.

Step 5. Add access rules

Add an access rule to allow traffic from your Client-to-Site VPN to your network. For more information, see [How to Configure an Access Rule for a Client-to-Site VPN](#).

Monitoring VPN connections

On the **VPN > Client-to-Site** page, you can monitor VPN connections. Clients authenticated via client certificate use a **Name** in the following format: `<GroupPolicy name>-<certificate serial number>-<username>`.

DASHBOARD CONFIGURATION CONTROL FIREWALL NAC VPN MAILGW DHCP PROXY LOGS STATISTICS EVENTS SSH Refresh if active Refresh (F5) Disconnect																	
Site-to-Site Client-to-Site Status Selection Filter NAC: 1 (9999) - Clients: 0 (9999) - SSL: 0																	
Name	Tunnel	Type	Group	Local	Peer	Virtual IP	Info	Transport	Encryption	Auth.	Compression	NAC	bps10	Total	Idle	Start	Key
Barracuda Group (1)																	
smard-242f27a9000000005a3d-user22	PGRP		smard	10.17.88.101	10.17.4.59	182.182.182.91	SC.Auth-user22DC-test,DC=sma...	TCP & ...	AES 128	MD5	0% (Packet)	-	480 B	147 K	0 s	46 s	46 s

The page lists all available Client-to-Site VPN tunnels. In the **Tunnel** column, the color of the square

indicates the status of the VPN:

- **Blue** - The client is currently connected.
- **Green** - The VPN tunnel is available but currently not in use.
- **Grey** - The VPN tunnel is currently disabled. To enable the tunnel, right-click it and select **Enable Tunnel**.

For more information about the **VPN > Client-to-Site** page, see [VPN Tab](#).

Troubleshooting

To troubleshoot VPN connections, see the `/yourVirtualServer/VPN/VPN` and `/Box/Control/AuthService` log files. For more information, see [LOGS Tab](#).

Next step

Configure the VPN client to connect to this VPN profile. For more information, see [Remote Access Clients](#).
