

## Adding a File Share Connection

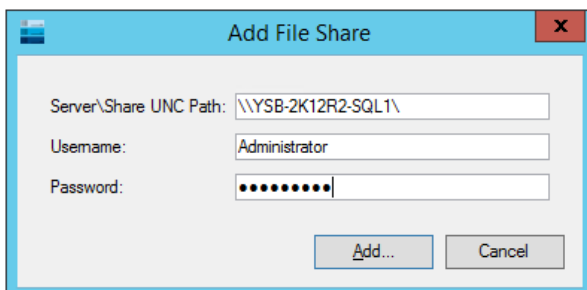

<https://campus.barracuda.com/doc/51190639/>

This feature is available for Windows machines running Yosemite Server Backup version 10.5.00 or newer.

Yosemite Server Backup can make direct connections to any Common Internet File System (CIFS) server / share. You can use this connection as a backup source or restore target - either in their entirety or parts within them.

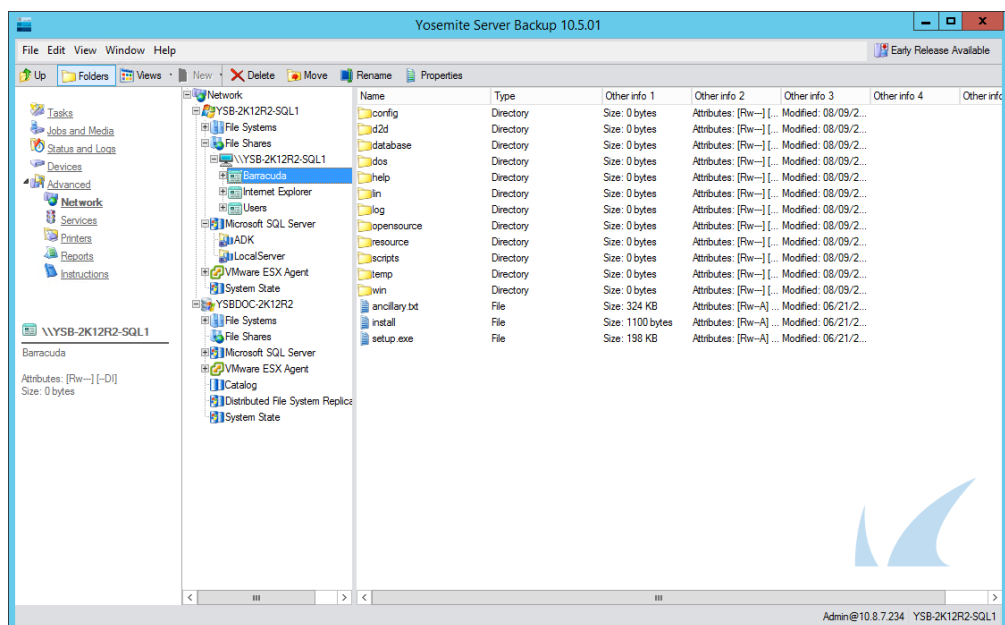

To add a file share connection:

1. In the **Navigation** bar, select **Advanced**, then **Network**. The network tree of your servers displays.
2. Within the desired server, click **File Shares**. Then click **Add**. (Alternatively, right-click the file share agent, then select **Add**.)
3. In the **Add File Share** window, enter a server or share name, along with its corresponding **Username** and **Password**. Then click **Add**.

Specify using the following format: **\\SERVER\_NAME** or **\\SERVER\_NAME\SHARE**

The file share appears. Note that the server displays with individual shares below it.

You are now able to protect the file share as a backup source or use it as a restore target.
