Understanding Global, Per-Domain, and Per-User Settings

https://campus.barracuda.com/doc/70587628/

This article describes the global, per-domain, and per-user setting behavior.

- Global settings in Barracuda Email Security Service are always used *unless* there is a per-domain or per-user setting, in which case, the global setting is overridden.
- If an administrator makes a change on the **Domains > Domain Settings** page for a domain, that change (per-domain) is used in place of the Global setting. The **Domain specific policies** (🚩) icon displays in the **Domain Options** column.
- Sender policies override Global settings and per-domain sender policies. The sender policy is used together with either the Global setting or per-domain setting, whichever is set. If there is a conflict, the sender policy is used.

To revert to Global settings:

1. Go to the **Domains** page, and click the **Domain specific policies** (🚩) icon for the domain you want to revert.
2. In the **Domain Options** column, click **Reset to account policies**, and click **OK** in the confirmation dialog box.
