

How to Configure OCSP Validation

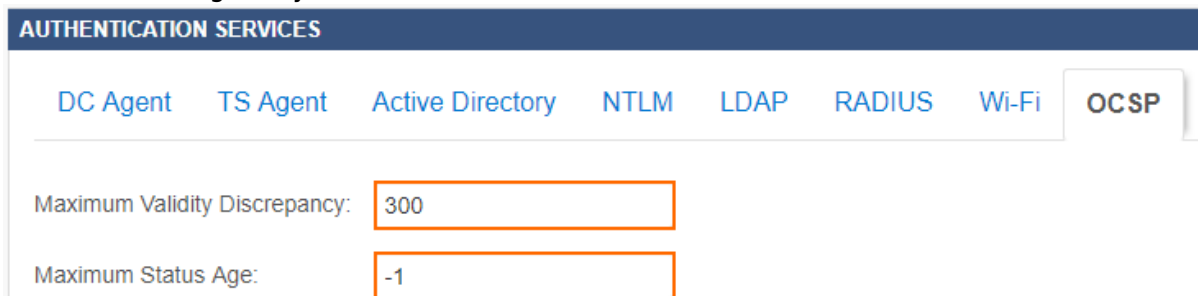

<https://campus.barracuda.com/doc/72516472/>

Activate OCSP as an external directory service. Online Certificate Status Protocol (OCSP) is a protocol used to check if X.509 certificates have been revoked by their respective certificate authorities (CAs). The CloudGen Firewall uses the information provided by OCSP to verify the authenticity of a certificate.

OCSP is not available for direct end-user authentication, but is used for online certificate verification by the VPN server.

Configure OSCP Validation

1. Go to **USERS > External Authentication**.
2. Click the **OCSP** tab.
3. Enter the settings for your OCSP server.

The screenshot shows the 'AUTHENTICATION SERVICES' configuration page. The 'OCSP' tab is selected. Two input fields are visible: 'Maximum Validity Discrepancy' with the value '300' and 'Maximum Status Age' with the value '-1'. Both input fields are highlighted with orange boxes.

4. Click **Save**.
