## Monitoring and Reporting

<https://campus.barracuda.com/doc/72516564/>

The firewall offers multiple audit and reporting functionalities to help you monitor activities throughout your network.

### Firewall Status

---

The firewall status view displays the overall traffic throughput of the firewall and provides an overview of blocked and allowed applications and connections. To access the firewall status window, go to **Basic > Status**. To display a specific time interval, click the time indicator on the top right of the **Firewall Statistics** element and select an option from the list. On the **Status** page, you can also view information about current license subscriptions, threats, used applications, connections, and users.

### Traffic Monitoring

---

The **Active Connections** tab provides real-time information on all currently active network connections passing through the firewall. The **Recent Connections** tab shows all recent network connections. You can limit and modify the displayed network traffic data by using filters. The **Application Monitor** tab provides information on application traffic such as risk, category, source, and destination. The firewall can also supply information to Network Management Systems via SNMP v2c and v3.

For more information, see [How to Configure the SNMP Service](#).

### Logging and Reporting

---

On the **Logs** page, you can view and manage log entries for processes running on the firewall.

For more information, see [Logging](#).

### Barracuda Report Creator

---

The Barracuda Report Creator creates reports containing statistics and logs that are collected on the firewall, including user activities, applications, and URL categories.

For more information, see [Barracuda Report Creator](#).
