How to Configure OSPF Routing over TINA VPN

https://campus.barracuda.com/doc/73719056/

To dynamically learn OSPF-propagated routes from a remote location connected via TINA VPN tunnel, VPN next hop interfaces are used to create an intermediary network.

You must complete this configuration on both the local and the remote CloudGen Firewalls by using the respective values below:

	Example values for the local firewall	Example values for the remote firewall
VPNR Next Hop Interface Index	1	1
VPN Next Hop Interface IP Address	192.168.20.1/24	192.168.20.2/24
Virtual Server Additional IP	192.168.20.1	192.168.20.2
VPN Local Networks	empty	empty
VPN Remote Networks	empty	empty
Router ID	192.168.20.1	192.168.20.2

Before You Begin

- A free /24 subnet (e.g., 192.168.20.0/24) for the intermediary network is required.

Step 1. Add a VPN Next Hop Interface

Add a VPN next hop interface using a /24 subnet (e.g., 192.168.20.0/24).

1. Go to **CONFIGURATION** > **Configuration Tree** > **Box** > **Virtual Servers** > *your virtual server* > **Assigned Services** > **VPN-Service** > **VPN Settings**.
2. Click **Lock**.
3. In the **Settings** tab, click the **Click here for Server Settings** link. The **Server Settings** window opens.
4. In the **Server Settings** window, click the **Advanced** tab.
5. Next to the **VPN Next Hop Interface Configuration** table, click **Add**.
6. In the **VPN Interface Properties** window, configure the following settings and then click **OK**.
   - In the **VPN Interface Index** field, enter a number between 0 and 999. E.g., 11
   - In the **IP Addresses** field, enter the VPN interface IP address including the subnet. E.g., 192.168.20.1/24 for the local CloudGen Firewall, or 192.168.20.2/24 for the

remote firewall.
- In the **Multicast Addresses** field, enter the OSPF multicast addresses: `224.0.0.5 224.0.0.6`

- Click **OK**. The interface is now listed in the **VPN Next Hop Interface Configuration** table.

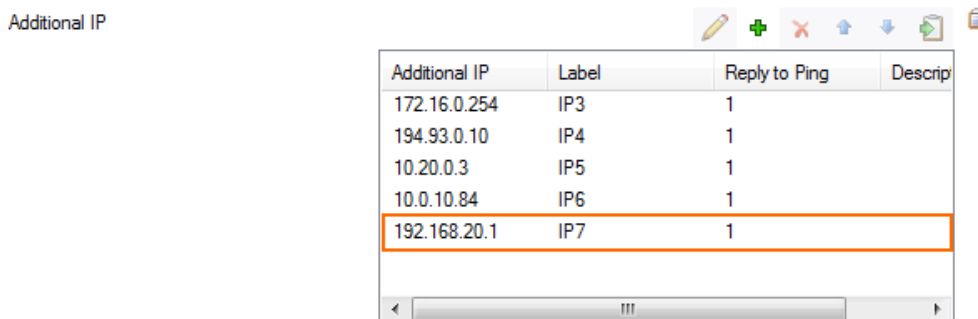

7. In the **Server Settings** window, click **OK**.
8. Click **Send Changes** and **Activate**.

Step 2. Add the VPN Next Hop Interface IP Address to the Virtual Server Listening IP Addresses

Introduce the IP address of the VPN next hop interface as a virtual server IP address.

1. Go to **CONFIGURATION** > **Configuration Tree** > **Box** > **Virtual Servers** > *your virtual server* > **Server Properties**.
2. Click **Lock**.
3. In the **Additional IP** table, add the IP address of the VPN next hop interface.

4. Click **Send Changes** and **Activate**.

Step 3. Configure the TINA Site-to-Site VPN Tunnels

You can configure the VPN tunnel using the GTI Editor for managed CloudGen Firewalls, or using the Site-to-Site configuration dialog if you are using standalone CloudGen Firewalls.

In the GTI Editor

Edit the VPN tunnel to remove the local and remote networks and add the VPN next hop interface ID.

1. Go to the global/range/cluster **GTI Editor**.
2. Click **Lock**.
3. Click on the VPN tunnel, and click on the first Transport to edit the VPN tunnel configuration. For more information, see How to Create a VPN Tunnel with the VPN GTI Editor.

4. Remove all **Local Networks** from the remote and local VPN services.
5. Enter the VPN next hop interface ID for the remote and local VPN services. E.g., 11

6. Click **OK**.
7. Click **Send Changes** and **Activate**.

Standalone CloudGen Firewalls

On both the remote and local firewalls, configure a TINA VPN tunnel with the VPN Interface Index. Leave the local and remote networks empty.

1. Log into the local CloudGen Firewall.
2. Go to **CONFIGURATION > Configuration Tree > Box > Virtual Servers > *your virtual server* > Assigned Services > VPN-Service > Site to Site**.
3. Click **Lock**.
4. Right-click in the **TINA Tunnels** tab and select **New TINA tunnel**. The **TINA tunnel** window opens.
5. Enter a **Name**.
6. Configure the **Transport**, **Encryption** and **Authentication** settings as well as the **Local** and **Remote** public IP addresses. For more information, see How to Create a TINA VPN Tunnel between CloudGen Firewalls.
7. Exchange the **Peer Identification** keys.
8. In the **Remote Networks** tab, enter the **VPN Interface Index** number that you created in the **VPN Interface Configuration** in step 1. E.g. 11

9. Click **OK**.
10. Click **Send Changes** and **Activate**.

Step 4. Configure the OSPF Service

The OSPF setup must be completed on both the local and remote firewalls. The configuration steps and values are the same except for the Router ID and propagated networks.

Step 4.1 Configure which Routes to Propagate into OSPF

Select the routes you want to propagate.

1. Go to **CONFIGURATION > Configuration Tree > Box > Network**.
2. Click **Lock**.
3. To propagate the management network, set **Advertise Route** to **yes** in the **Management IP and Network** section.

Management IP and Network	
Interface Name	eth0
Management IP (MIP)	10.0.10.88
Associated Netmask	25-Bit
Responds to Ping	yes
Use for NTPd	yes
Advertise Route	yes

4. In the left menu, click on **Routing**.
5. Double-click on the direct attached and gateway routes you want to propagate. The **Routes** window opens.
6. Set **Advertise Route** to **yes** and click **OK**.

Route Configuration	
Target Network Address	10.17.0.0/16
Route Type	gateway
Interface Name	
Gateway	10.0.10.1
Route Metric	
Source Address	
Trust Level	Unclassified
Default Gateway	
Advertise Route	yes
Route Origin	User created
Active	yes

7. Click **Send Changes** and **Activate**.

Step 4.2 Configure the OSPF Router

Enable OSPF and use the VPN Next Hop interface IP address as the Router ID.

1. Go to **CONFIGURATION** > **Configuration Tree > Box > Virtual Servers >** *your virtual server* **> Assigned Services > OSPF-RIP-BGP-Service > OSPF/RIP/BGP Settings**.
2. Click **Lock**.
3. Set **Run OSPF Router** to **Yes**.

4. Set **Operation Mode** to **advertise-learn**.
5. Enter the **Router ID**. Typically the VPN next hop interface IP address is used. E.g., 192.168.20.1 for the local CloudGen Firewall, or 192.168.20.2 for the remote firewall.

Operational Setup		
Run OSPF Router	yes	🗑
Run RIP Router	no	🗑
Run BGP Router	no	🗑
Hostname	HQVIRT1	🗑
Operation Mode	advertise-learn	🗑
Router ID	192.168.20.1	🗑

6. In the left menu, click **OSPF Router Setup**.
7. Select **Cisco Type** from the **ABR Type** drop-down.
8. Enter the **Terminal Password**. Use this password if you must directly connect to the dynamic routing daemon via command line for debugging purposes.

> The password can consist of small and capital characters, numbers, and non alpha-numeric symbols, except the hash sign (#).

9. Click **Send Changes** and **Activate**.

Step 4.3. Create an OSPF Area Setup

1. Go to **CONFIGURATION** > **Configuration Tree > Box > Virtual Servers > *your virtual server* > Assigned Services > OSPF-RIP-BGP-Service > OSPF/RIP/BGP Settings**.
2. Click **Lock**.
3. In the left menu click **OSPF Area Setup**.
4. In the **OSPF Area Configuration**, click **+** to add **Areas**.
5. Enter the OSPF area **Name**.
6. Click **OK**. The **Areas** window opens.
7. From the **Area ID Format** dropdown, select **Integer**.
8. Enter the **Area ID[Int]**. E.g., 0
9. If authentication is selected in the **Parameter Template** select the **Authentication Type**.
10. Click **+** add the VPN next hop interface network to the **Network Prefix** table: E..g, 192.168.20.0/24

11. Click **OK**.
12. Click **Send Changes** and **Activate**.

Step 6. Verify the OSPF Service Configuration

On the **CONTROL > Network** page, verify that OSPF is active on the VPN next hop interface and that the remote CloudGen Firewall is listed as an OSPF neighbor. The routes learned via OSPF are listed with a type of **gateway-ospf** in the routing table. The **Interface** is the VPN next hop interface and the **Gateway** the IP address of the remote VPN next hop interface IP address.

Local Firewall **CONTROL > Network > OSPF** page:

Remote Firewall **CONTROL > Network > OSPF** page:

Step 6. Create Access Rules for VPN Traffic

Create access rules on both local and remote firewalls to allow traffic from the learned networks through the VPN tunnel. For more information, see How to Create Access Rules for Site-to-Site VPN Access.
