
How to Migrate a Standalone Hardware Firewall to a new Model

<https://campus.barracuda.com/doc/73719763/>

When replacing a hardware firewall with a new model, the firewall configuration must be migrated. You can migrate the firewall configuration to the last revision of the direct successor model, or to the last revision of the next larger model. In a high availability cluster, the primary firewall configuration is migrated. The secondary firewall is joined into the HA cluster by creating the PAR file for the secondary firewall on the primary firewall after the migration.

Before You Begin

Verify that the firewall model you are migrating to is supported for the source model. For more information, see [Migrating to a New Hardware Model](#).

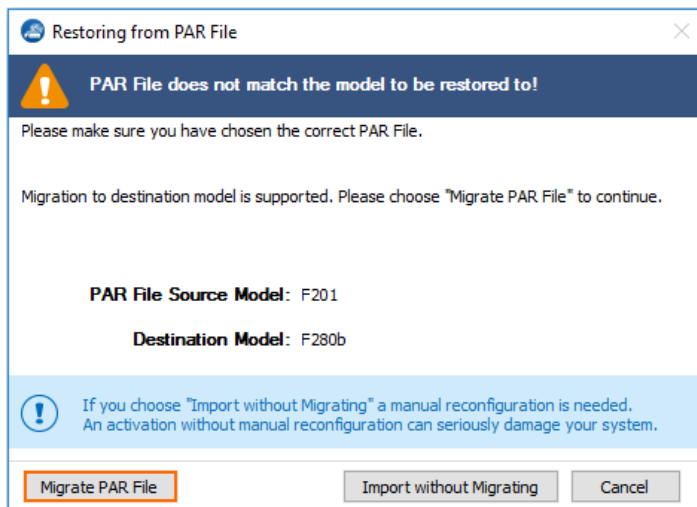

Step 1. Create a PAR File from the Source Firewall

1. Log into the source firewall.
2. Go to **CONFIGURATION > Configuration Tree**.
3. Right-click **Box** and click **Create PAR file**. The **Save as** window opens.
4. Click **Save**.

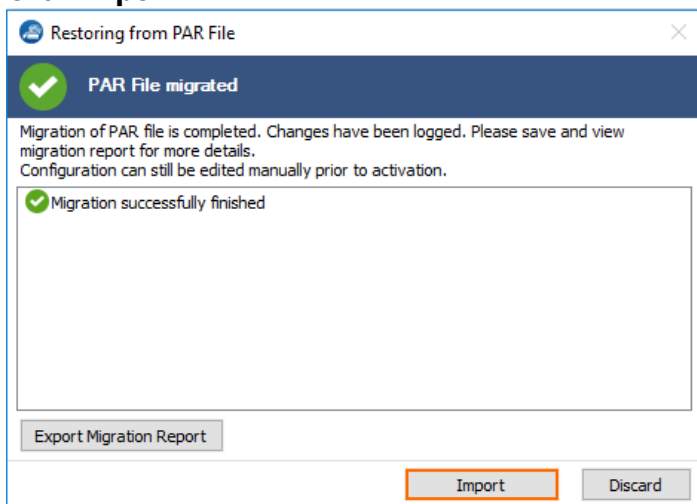

Step 2. Import and Migrate on the Destination Firewall

Import the PAR file on the destination firewall. The model mismatch is automatically detected.

1. Log into the destination firewall.
2. Go to **CONFIGURATION > Configuration Tree**.
3. Right-click **Box** and click **Restore from PAR file**. The **Restore from PAR file window opens**.
4. Click **OK**.
5. Select the PAR file and click **Open**. The **Restoring from PAR file** windows opens.
6. Click **OK**.
7. Click **Migrate PAR File**.

8. (optional) click **Export Migration Report** to create a log file with the changes.
9. Click **Import**.

10. (if required) Complete manual migrations, or verify configuration nodes that were not migrated automatically.
11. Click **Activate**.

Step 3. Restart the Firmware and Activate the Network Configuration

1. Log into the destination firewall.
2. Go to **CONTROL > Box**.
3. In the left menu, expand the **Operating System** section and click **Firmware Restart**. This may take some time.
4. If required, click **Reconnect**.
5. In the left menu, expand the **Network** section and click **Activate new network configuration**.
6. Click **Failsafe**.

Step 4. (HA cluster only) Create a PAR File for the Secondary Firewall

If you are migrating a high availability cluster, create the PAR file for the secondary firewall on the primary firewall that has already been migrated. For more information, see [How to Set Up a High Availability Cluster](#).

The new hardware appliance is now running the same firewall configuration. You can now perform the hardware switch.
