

## How to Configure Barracuda DNS Nameservers on Windows 10

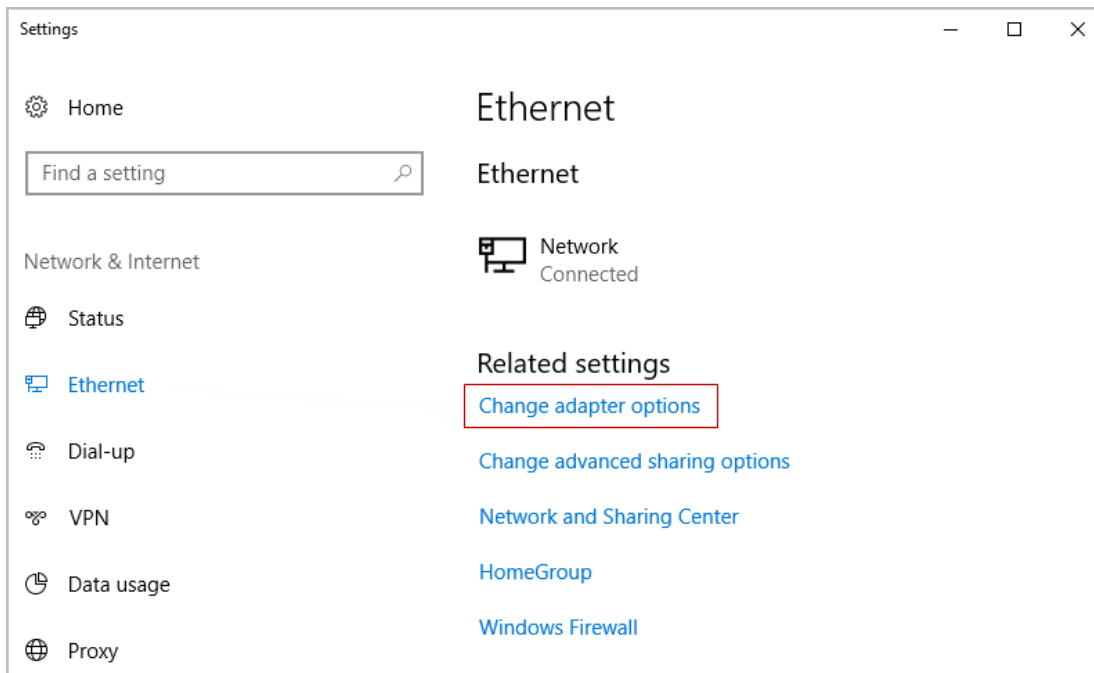

<https://campus.barracuda.com/doc/78152429/>

In order to use the Barracuda DNS Filtering Service, you must direct your computer(s) (laptop / desktop) to the assigned Barracuda Domain Name Server (DNS). The IP address for the Barracuda DNS nameservers are shown on the **Configure DNS** page of the **Add Location** popup, which you access on the **DNS FILTERING** page.

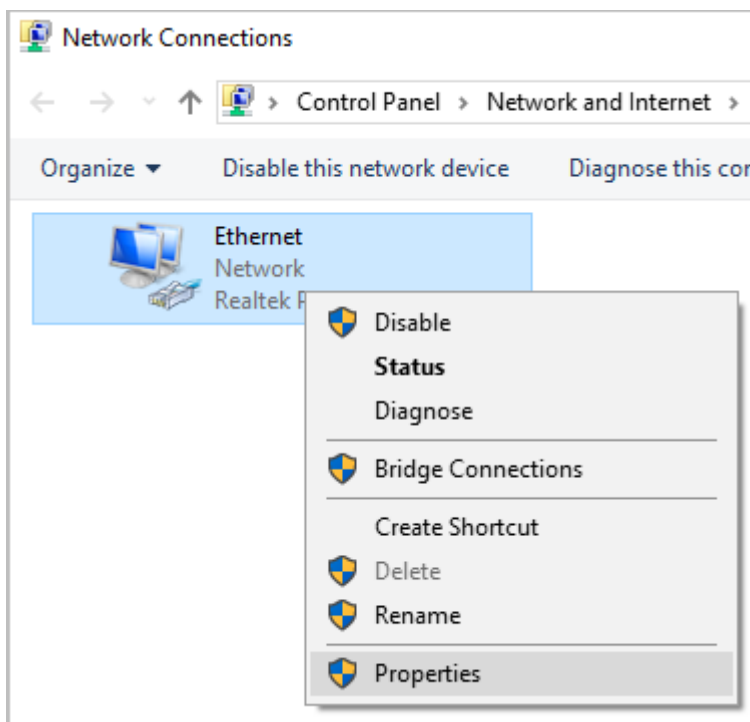

1. Right click the Start menu and select **Network Connections**.

2. Click **Ethernet**, and in **Ethernet** click **Change adapter options**.

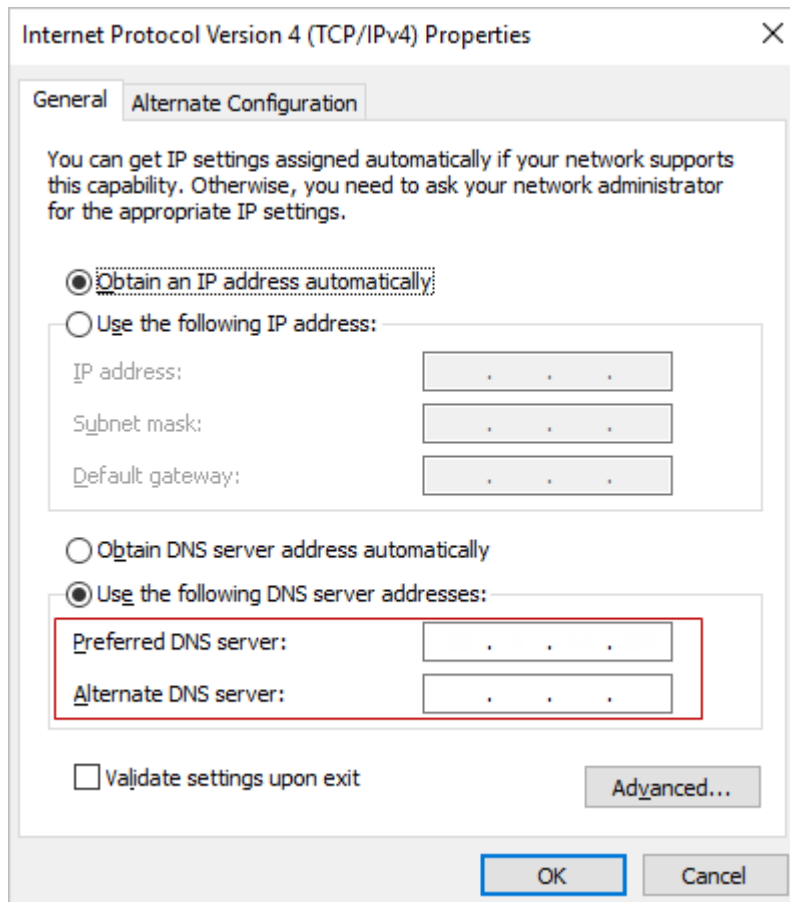

3. Right click the network connection you are using and select **Properties**.

4. Highlight the **Internet Protocol Version 4 (TCP/IPv4)** option, then click **Properties**.

5. Select **Use the following DNS server addresses** and fill out the **Preferred DNS server** and **Alternate DNS Server** fields with the Barracuda DNS server IP addresses. Click **OK**.

6. Clear your browser and DNS cache. This ensures that your new DNS configuration settings take effect immediately.
