

How to Configure Barracuda DNS Nameservers on Windows 8

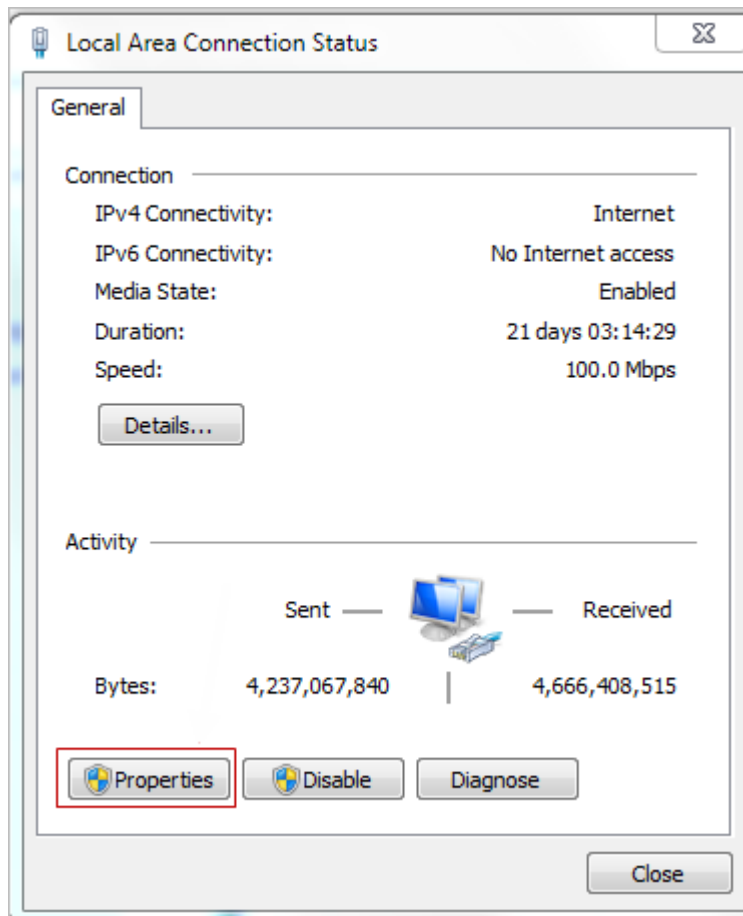

<https://campus.barracuda.com/doc/78152431/>

In order to use the Barracuda DNS Filtering Service, you must direct your computer(s) (laptop / desktop) to the assigned Barracuda Domain Name Server (DNS). The IP address for the Barracuda DNS nameservers are shown on the **Configure DNS** page of the **Add Location** popup, which you access on the **DNS FILTERING** page.

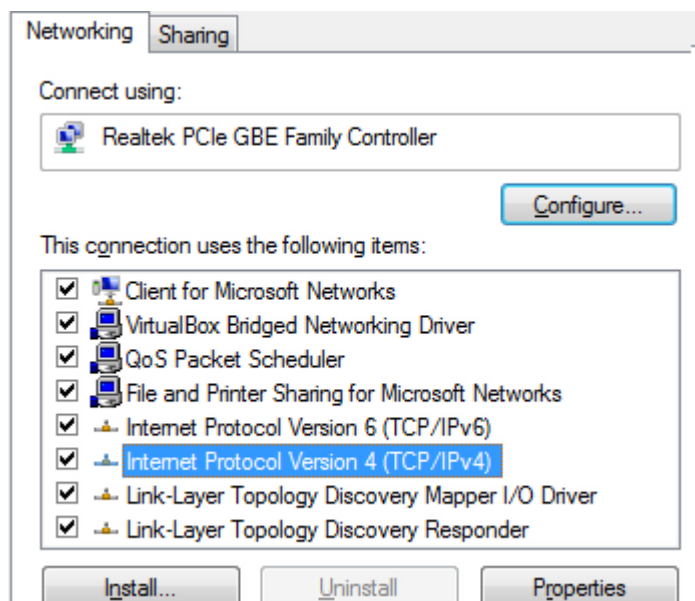

1. From the Windows 8 Desktop, right click the **Networks** icon and select **Open Network and Sharing Center**.
2. Click on your primary connection or **Local Area Connection** under **Active Networks**.
3. While in the **Open Network and Sharing Center**, click the current active connection or the connection that you want to configure the Barracuda nameserver on.

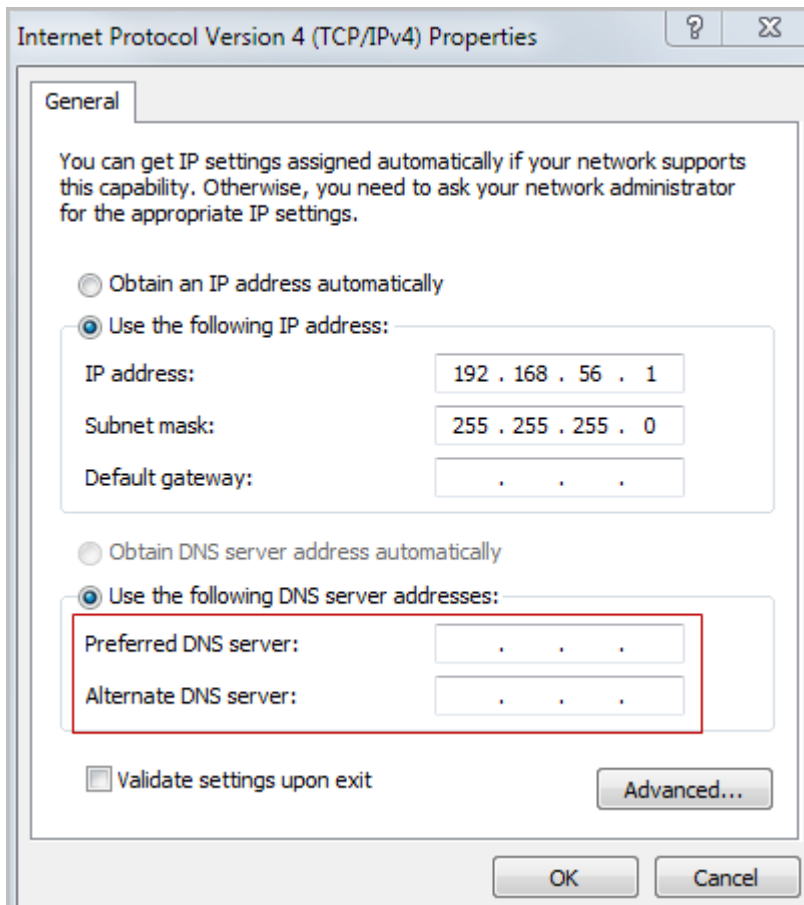

4. Choose/open the properties for that connection.

5. Highlight the Internet Protocol Version 4 (TCP/IPv4) option, then click Properties.

6. Select **Use the following DNS server addresses** and fill out the **Preferred DNS server** and **Alternate DNS Server** fields with the Barracuda DNS server IP addresses. Click **OK**.

7. Clear your browser and DNS cache. This ensures that your new DNS configuration settings take effect immediately.
