Release Notes Version 6.3.0.005

https://campus.barracuda.com/doc/78153055/

Before installing any firmware version, back up your configuration and read all release notes that apply to versions more recent than the one currently running on your system.

Before upgrading a virtual machine instance, take a snapshot. In the unlikely event that there is a problem with the kernel, you could use the snapshot to revert and attempt the upgrade again.

Do not manually reboot your system at any time during an update unless otherwise instructed by Barracuda Networks Technical Support. Depending on your current firmware version and other system factors, updating can take 10 to 20 minutes (updates which include a kernel upgrade take longer). If the process takes much longer than 20 minutes, contact Barracuda Networks Technical Support for assistance.

Fixes

- For the GSLB configuration, SRV records specified with a custom protocol are now allowed, in addition to the TCP and UDP protocols. [BNADC-9493]
- The UI did not allow you to edit two separate service types specified with the same IP address and port. This issue has been fixed. [BNADC-9531]
- Virus definition updates using an offline update are now working. [BNADC-9691]
