

Pause Offsite Replication

<https://campus.barracuda.com/doc/78809436/>

You can temporarily disable the site-to-site replication feature for one or more destinations. Pausing replication causes data from the appliance to be queued for 24 hours; data replication automatically resumes after 24 hours. For example, this allows you to move the destination system to a remote location without getting replication errors. If the 24 hours pass without manually re-enabling this feature, the Barracuda Backup appliances attempt to communicate with each other and, if successful, perform replication.

To temporarily disable site-to-site replication, go to the **Backup > Replication** page. In the **Sending Data To** table, click on the **Settings** link beside the destination Barracuda Backup appliance. On the **Replication Target Settings** page, clear **Enable data replication**.

Offsite replication can only be paused on Barracuda Backup devices acting as offsite replication destinations. Offsite replication to Barracuda Cloud Storage and AWS cannot be paused.
