

How to Set Up a Managed High Availability Cluster from Two Stand-Alone Firewalls

<https://campus.barracuda.com/doc/79463110/>

Both systems that you set up in a high availability (HA) cluster must be the same model and firmware version, but do not have to be the same hardware revision. For instructions on how to configure an HA cluster using different revisions of the same appliance model, see [How to Restore the High Availability Cluster Configuration after an RMA](#).

When configuring a CC-managed HA pair, the secondary firewall receives its configuration through the primary firewall. For a better overview and management of both firewalls, only the primary firewall is displayed in the Control Center's configuration tree. Each change made on the primary firewall is immediately propagated to the configured secondary firewall.

On the Control Center's status map, both the primary and the secondary firewall is displayed as soon as the configuration for both firewalls is completed.

Before You Begin

- Ensure that a range and a cluster are configured where the primary and secondary firewalls are going to be configured.
- Ensure that both stand-alone firewalls are running firmware version 8.0.1.
- Ensure that the management IP address (MIP) of both firewalls are in the same subnet.

Step 1. Create the PAR File for the Primary Firewall

1. Log into the firewall that will be the future primary firewall.
2. Go to **CONFIGURATION > Configuration Tree**.
3. Right-click **Box**.
4. In the list, click **Create PAR file...**

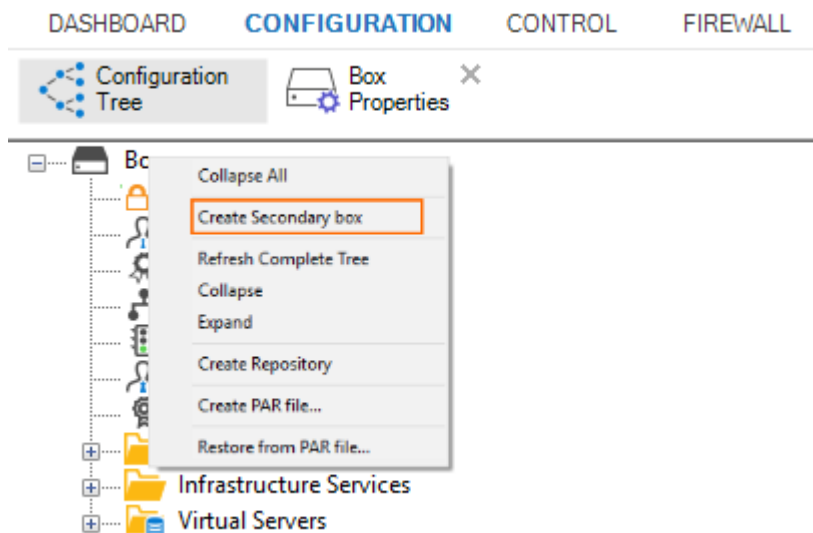

Step 2. Import the PAR File into the Control Center

1. Log into the Control Center.
2. Go to **CONFIGURATION > Configuration Tree > Multi Range > your range > your cluster > Boxes**.
3. Right-click **Boxes**.
4. In the list, click **Import Box from PAR...**
5. Click **Activate**.

Step 3. Create the Secondary Firewall

On the Control Center, the configuration node for the secondary HA firewall must be created within the Configuration Tree. For this, the two nodes Properties and Network will be replaced by a new node with the same name that also includes the edit fields for the secondary firewall.

1. Go to **CONFIGURATION > Configuration Tree > Multi Range > your range > your cluster > Boxes > your box** .
2. Right-click **Box** and select **Create Secondary Box**.

3. The **Box Properties** and **Network** nodes are replaced by a new node, each suitable for an HA configuration.

4. Open the **Network** page.
5. Enter the **Management IP (MIP)** for the secondary firewall. The MIPs of the HA pair must be in the same subnet.

Device Name

Hostname

Management IP and Network

Interface Name Other

Management IP (MIP)

Secondary Management IP (MIP)

Associated Netmask

Responds to Ping

6. Click **Send Changes** and **Activate**.

Step 4. Create the PAR File for the Primary Firewall

The new configuration in the Network node must be propagated to the primary firewall.

1. Go to **CONFIGURATION > Configuration Tree > Multi Range > your range > your cluster > Boxes > your box**.
2. Right-click **Box** and select **Create PAR file for box...**
3. Save the PAR file for the primary firewall.

Step 5. Import the PAR File into the Primary Firewall

Log into your stand-alone firewall that must be turned into the primary firewall.

1. Go to **CONFIGURATION > Configuration Tree > Box**.
2. Right-click **Box** and select **Restore from PAR file**.
3. Click **OK**.
4. Select the PAR file that you already created for your primary firewall and click **OK**.
5. Click **Activate**.

Step 6. Activate the New Network Configuration for the Primary Firewall

1. On the primary firewall, go to **CONTROL > Box**.
2. In the left navigation pane, expand **Network** and click **Activate new network configuration**.
3. Select **Failsafe** as the activation mode.
4. In the left menu, expand **Operating System** and click **Reboot Box**.

Step 7. Create the PAR File for the Secondary Firewall

The new configuration in the Network node must be also propagated to the secondary firewall.

1. On the Control Center, go to **CONFIGURATION > Configuration Tree > Multi Range > your range > your cluster > Boxes > your box**.
2. Right-click **Box** and select **Create PAR file for box...**

3. Save the PAR file for the secondary firewall.

Step 8. Import the PAR File into the Secondary Firewall

Log into your stand-alone firewall that must be turned into the secondary firewall.

1. Go to **CONFIGURATION > Configuration Tree > Box**.
2. Right-click **Box** and select **Restore from PAR file**.
3. Click **OK**.
4. Select the PAR file that you already created for your secondary firewall and click **OK**.
5. Click **Activate**.

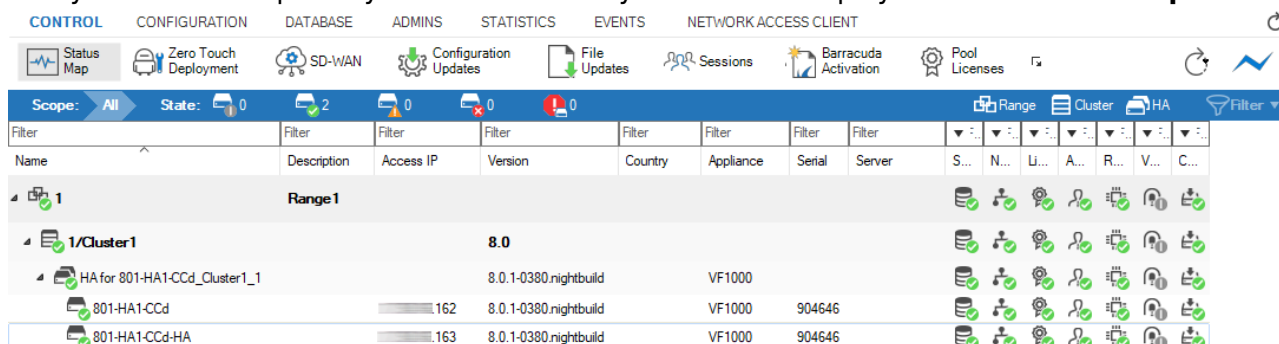

Step 9. Activate the New Network Configuration for the Secondary Firewall

1. On the secondary firewall, go to **CONTROL > Box**.
2. In the left navigation pane, expand **Network** and click **Activate new network configuration**.
3. Select **Failsafe** as the activation mode.
4. In the left menu, expand **Operating System** and click **Reboot Box**.

Step 10. Verify the Configuration Change in the Control Center

On the Control Center, both the primary and the secondary firewall will be displayed in the **Status Map** after a successful reboot.

1. On the **Control Center**, go to **CONTROL > Status Map**.
2. Verify that both the primary and the secondary firewall are displayed in the **Status Map**.

The screenshot shows the Barracuda Control Center interface. The top navigation bar includes tabs for CONTROL, CONFIGURATION, DATABASE, ADMINS, STATISTICS, EVENTS, and NETWORK ACCESS CLIENT. Below the navigation bar, there are various icons for Status Map, Zero Touch Deployment, SD-WAN, Configuration Updates, File Updates, Sessions, Barracuda Activation, and Pool Licenses. The main area displays a table of firewalls under the 'Range 1' cluster. The table has columns for Name, Description, Access IP, Version, Country, Appliance, Serial, Server, and several status icons. The firewalls listed are:

Name	Description	Access IP	Version	Country	Appliance	Serial	Server	S...	N...	Li...	A...	R...	V...	C...
1/Cluster1			8.0											
HA for 801-HA1-CCd_Cluster1_1			8.0.1-0380.nightbuild		VF1000									
801-HA1-CCd		162	8.0.1-0380.nightbuild		VF1000	904646								
801-HA1-CCd-HA		163	8.0.1-0380.nightbuild		VF1000	904646								

Step 11. Verify that the Primary and Secondary Firewall are Managed by the Control Center

1. In Firewall Admin, double-click the name of the primary and/or secondary firewall.
2. Firewall Admin connects to the firewall and displays the configuration window.
3. Go to **CONFIGURATION > Configuration Tree**.
4. Verify that the top entry of the configuration tree displays the name **HA Cluster (Primary / Secondary)(Managed by Control Center)**.

Configuration Tree Primary Firewall
