How to Manage Deployment of the Barracuda Content Shield Suite for Windows

https://campus.barracuda.com/doc/79463711/

The Barracuda Content Shield Suite for Windows supports Windows Server 2012 R2, 2016 and 2019. For endpoint computers using Firefox, Barracuda Content Shield Suite requires Firefox 68.0 or later.

The suite is installed on endpoint machines with one of the following methods:

- Manually, using the command line
- RMM (see How to Deploy the Barracuda Content Shield Suite Using RMM Solutions)
- Microsoft Intune (an MDM)
- GPO (see How to Deploy the Barracuda Content Shield Suite via GPO)

The suite includes the following components:

- Malware Prevention Component (MPC) – Local file risk analysis, checking against known malware signatures to provide an additional layer of Malware Prevention. Note that this component is installed, but gets disabled if you set **Malware Prevention** to *Disabled* on the **THREAT POLICY** page. **With version 2.1 and later, the MPC agent is not installed by default; you must elect to install it**.
- Web Filtering Component (WFC) – Content protection for web traffic.

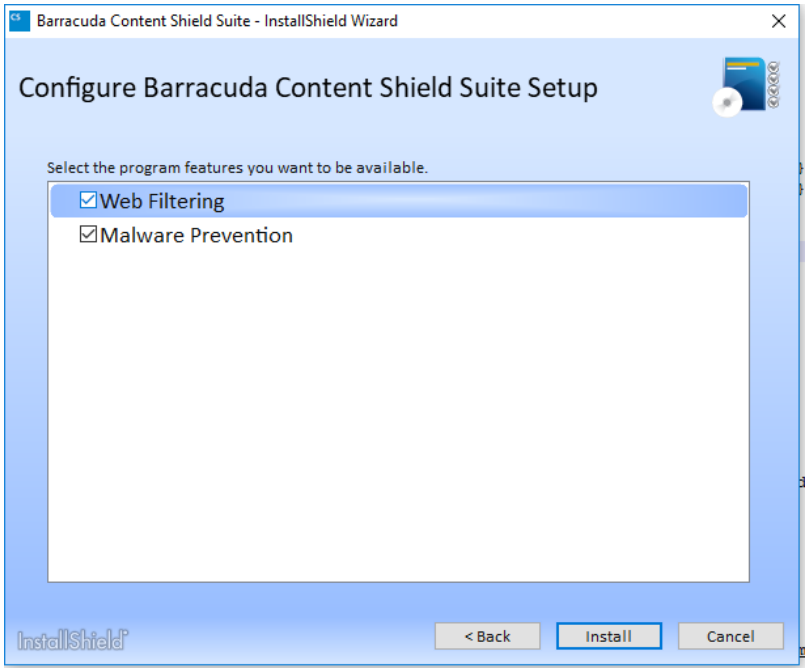
After installing the suite, see How to Use the Barracuda Content Shield Suite for Windows for details about the user interface on the endpoint.

Windows Installation

For manual installation on one of the endpoint machines:

1. Log into your Barracuda Content Shield account.
2. Go to the **Downloads** page.
3. Click **Download** to download the Windows Agent installer. The installer file is named `BarracudaContentShieldSetup-[version].exe`.
4. Click **Account Configuration** File to download the configuration file. This file is named `bcs.key`. The configuration file is picked up by the installer when you run it. Put this file and the installer file in the same folder on the endpoint computer. Note that network drives may present permissions issues.
5. Run the `BarracudaContentShieldSetup-[version].exe` executable on the endpoint, accept the license agreement, and follow the prompts in the wizard to install.

6. After browsing for the `bcs.key` file on the **Locate Account Configuration** screen, the wizard presents a **Setup Type** dialog with options for **Complete** or **Custom** installations:
    - Selecting **Complete** installs only the Web Filtering component (WFC) – OR –
    - *Selecting **Custom** installs only the Web Filtering component by default,* but you can check the **Malware Prevention** box if you want to install the MPC as well.



When you uninstall the suite from the endpoint machine, you will be prompted to either reboot the machine or choose to reboot later. Barracuda recommends rebooting if you want to reinstall the suite at a later time.

Managed Deployment Using RMM or GPO

You can either use an RMM or GPO to install and distribute to endpoint machines if you don't want to do manual installations. If you use an RMM or GPO, make sure to indicate that the installer (`BarracudaContentShieldSetup-[version].exe`) and the configuration file (`bcs.key`) must be in the same folder. See How to Deploy the Barracuda Content Shield Suite Using RMM Solutions and How to Deploy the Barracuda Content Shield Suite via GPO for details.

Upgrade Using Windows

When you run the Windows installer, if there is a newer version of the Barracuda Content Shield Suite,

you will see the **Upgrade** button in the installer Welcome screen. Click **Upgrade** and follow the wizard prompts. *This will only upgrade features you have installed.*

Command Line Installation / Upgrade / Uninstallation (silent)

See command line syntax and examples of each process in the table below.

> **Important note on uninstalling:** If *uninstalling* using the Windows installer, you will be prompted for a password to uninstall (also with command line). **If you don't have the password you cannot uninstall the agent.** See Agent Settings for details on the Tamper Proof feature (**Allow Agent Removal**) and setting this password.

To install from the command line on one of the endpoint machines:

1. Follow steps 1-4 above.
2. From the command line, run the appropriate command from the examples in the table below, depending on your scenario. **Note:** with version 2.1 and higher, the Windows installer (`BarracudaContentShieldSetup-[version].exe`) *only* installs the WFC. If you want to install the MPC as well, use the `"ISFeatureInstall="` parameter as shown below in the table. To install both components, set `ISFeatureInstall=` WebFiltering,MalwarePrevention. Note: For KEYPATH = "*path/to*/bcs.key" , replace the example in italics with the actual path to the `bcs.key` file. For USER_PASS, enter the password you created on the **AGENT SETTINGS** page for **Allow Agent Removal.**

Install / uninstall complete suite	**Syntax**
Install	`BarracudaContentShieldSetup-[version].exe KEYPATH="`*`path/to/bcs.key`*`" /silent`
Uninstall	`BarracudaContentShieldSetup-[version].exe USER_PASS="my_password" /remove /silent`
Uninstall, and then reboot the endpoint machine	`BarracudaContentShieldSetup-[version].exe USER_PASS="my_password" /remove /silent & shutdown /r /t 0`
Partial install	

Only install WFC (default)	`BarracudaContentShieldSetup-[version].exe KEYPATH="path/to/bcs.key" /silent`
Only install MPC	`BarracudaContentShieldSetup-[version].exe ISFeatureInstall="MalwarePrevention" KEYPATH="path/to/bcs.key" /silent`
Upgrade the suite	
Upgrade the suite to the latest version	`BarracudaContentShieldSetup-[version].exe /silent`

Sample Script For Use With RMM, GPO, Intune and Other Deployment Solutions

Use an elevated command prompt (run cmd.exe as administrator) for deployment. Apply the following parameter values to suit your target environment.

Parameters

Parameter	Type	Description
action	string	**options: [install | remove]** Use 'install' for installation or upgrading your installation to the next version. Use 'remove' to uninstall the agent and clean up the machine.
workDir	string	If the workDir does not yet exist, it will be created as specified. In that case the executable as mentioned in 'setupName' parameter as well as the .key as mentioned in 'keyName' parameter are assumed in same dir as the ConfigBCSPlus.ps1 script. This is useful, if you want to use this script for deployment via Intune or another tool where the contents are zipped up and saved to an undisclosed folder. This way you have more control over where the files will end up - as well as the log file to check in on the result.
setupName	string	**BarracudaContentShieldSetup-[VERSION].exe** - make sure the version is part of the string - or if renaming this exe make sure the -version parameter is passed with the version to install. Only needed for action 'install'.
keyName	string	**bcs.key** - the name of the account configuration file. Only needed for action 'install'.

feature	string	**options: [WebFiltering | MalwarePrevention]**. **OPTIONAL**. Only needed if installation is customized to install also / only MalwarePrevention. (Default: install only WebFiltering), example for override: *-feature* "*WebFiltering,MalwarePrevention*" (use this if you want to install MalwarePrevention on top of default WebFiltering component)
version	string	1.2.3.4 - the version of the new installer. **OPTIONAL.** Only needed if original installer executable is renamed.
logEventLog	string	*-logEventLog '1'* . **OPTIONAL**. Only needed if you want to log to the Application Event log which is part of the System Event logs. All tool output is redirected to this event log.

Deployment script source code

This script is provided as an example only.

```
 param(
    [Parameter(Mandatory=$true,HelpMessage='Specify "install" or "remove"')]
    [string]$action='',

    [Parameter(Mandatory=$true,HelpMessage='Specify working directory. Gets
created if does not exist and setup files are copied here.')]
    [string]$workDir='',

    [Parameter(HelpMessage='Required for "install" action only. BCS setup
executable file name')]
    [string]$setupName='',

    [Parameter(HelpMessage='Required for "install" action only. BCS account
configuration (*.key) file name')]
    [string]$keyName='',

    [Parameter(HelpMessage='Required for customized "install" only. Set to
"WebFiltering" or "MalwarePrevention". Not setting this defaults to install
both.')]
    [string]$feature='',

    [Parameter(HelpMessage='Optional. Pass version, i.e. "2.0.0.0", if
original installer filename is renamed.')]
    [string]$version='',

    [Parameter(HelpMessage='Optional. Pass this flag and set to "1" if
logging to Event log Application.evtx')]
    [string]$logEventLog='',

    [Parameter(HelpMessage='User password for uninstall (obsolete, since
```

```
tamperproof gets disabled in this script)')]
    [string]$userPass=''

) #Must be the first statement in the script

#### CUSTOM SETUP
#################################################################
<#
=NOTES
================================================================================

 -- TESTED WITH WIN10. Needs adjustments for running on WIN7 (Powershell <
3.0), i.e. "Tee-Object" --

 Make sure to adjust the parameter contents for install/upgrade or uninstall
to your setup

 Deploy via GPO:
  Create a per-machine GPO that executes a Startup Script (make sure it runs
elevated) that invokes the powershell script - or any other script that you
created to install / remove the agent suite installer (executable)

 Return codes:
  # exitcode 3010 currently returned as 0. Remove condition from ExitWithCode
function in order to receive this return code.
  # 3010 - Uninstall successful. Reboot pending: On uninstall a reboot
required before reinstalling the agent.

  0    - Installation successful. (Also on a "remove" action, if the agent is
not installed):: 1601 - Install aborted. SETUP.EXE not found.
  1601 - Install aborted. SETUP.EXE not found.
  1602 - Install aborted. Check KEYPATH value.
  1603 - Uninstall canceled. Most likely because either tamper proof is
disabled or wrong password was provided
  For any of the 16xx return codes, please check the component MSI logs that
can be found in the %temp% folder of the process owner
