Restore Considerations and Recommendations

https://campus.barracuda.com/doc/86545823/

Before restoring data, you must disable any backup sets that might run during the restore to prevent overwriting the production data that is being restored.

This requirement is especially relevant if you have previously restored the computer from an image backup containing an older version of the file catalog than when you last backed up. Running a backup using the older catalog replaces the one that exists on Barracuda servers, thereby removing files more recently backed up.

If a machine is restored to a previous time with an Image, you need to create a new subaccount.

For procedures to restore backup sets, see the ECHOplatform Backup and Restore Reference Guide.
