

Setting Up and Enabling Integrations with Fieldpoint

<https://campus.barracuda.com/doc/89620809/>

The following section describes how to enable and make the **Fieldpoint** integration public to **VARs** so that they can integrate their **Virtual Service Center** with **Fieldpoint**.

1. In the **Hosted Console** website, click **Configuration > Service Desks**.
2. Click **Add**, then select **Fieldpoint**.
3. Ensure the **Enable** check box is selected.
This will ensure the integration is enabled and ready to communicate with **Fieldpoint**.
4. In the **Service Identification** section, modify the **Name** and **Description**, if required.
5. Select the **Available to all VARs** check box.
This will make the integration visible to all **VARs** and allow them to configure their respective account settings and ticketing options.
6. If desired, click the **Advanced Settings** button.
We recommend that the settings in the advanced properties not be edited. Contact Technical Support if you attempt to change these settings and the configuration fails.
7. In the **Web Service Configuration** section, do the following:
 - The **Authentication** is set to **Disabled** and the **Require SSL** box is not selected by default; however, you can modify them if required.
 - Type the **WSDL Location** in the boxes. In most instances, only the protocol, server and port need to be configured. The trailing **URL** should remain intact.
 - Click **Validate** to connect to the **Tigerpaw** service and in the **Method to Invoke** list, select **SubmitAlert**.
 - The **Tokens** boxes are populated automatically.
 - For the **Response Type**, select either **XML** or **String**.
 - In the **Filter** box, accept the default.
8. In the **Ticket Linking** section, accept all the defaults in all boxes.
9. Click **Save**.
