

Setting Up and Enabling Integrations with Solutions360

<https://campus.barracuda.com/doc/89620810/>

The following section describes how to enable and make the **Solutions360** integration public to **VARs** so that they can integrate their **Virtual Service Center** with **Solutions360**.

1. In the **Hosted Console** website, click **Configuration > Service Desks**.
2. Click **Add**, then select **Solutions360**.
3. Ensure the **Enable** check box is selected.
This will ensure the integration is enabled and ready to communicate with **Solutions360**.
4. In the **Service Identification** section, modify the **Name** and **Description**, if required.
5. If desired, click the **Advanced Settings** button.

We recommend you don't edit the Advanced Settings. Contact Technical Support if you attempt to change these settings and the configuration fails.

6. In the **Web Service Configuration** section, do the following:
 - The **Authentication** section, select **Disabled** from the **Authentication** list and disable the **Require SSL** check box.
 - Type the **WSDL Location** in the boxes. In most instances, only the **protocol**, **server** and **port** need to be configured. The trailing **URL** should remain intact.
 - The **Method to Invoke** and the **Tokens** boxes are populated automatically.
 - For the **Response Type**, select either **XML** or **String**.
 - In the **Filter** box, accept the default.
