## Agent Settings

<https://campus.barracuda.com/doc/93201092/>

These settings apply to the Barracuda Content Shield (BCS) Suite, if you have it deployed on endpoint machines.

---

### Agent Settings

- **Allow Agent Removal:** The Tamper Proof feature prevents the user from removing the BCS agent from the endpoint. However, by setting this option to *ON*, you can bypass the Tamper Proof feature. This requires creating an **Agent Password**, which must be used when uninstalling the agent at the endpoint. **You will not be able to uninstall the agent on the endpoint if you do not set this feature to ON and set a password.**
- **Max CPU Usage:** Configure the maximum CPU resource you want to allow the BCS agent to use on the endpoint.

---

### Agent Update

Click **Apply Agent Updates** to select how you want to apply updates to the BCS Suite on endpoint machines. **Note that Automatic updates only apply to Windows machines.**

- **Manually**
- **Automatically When Devices Reboot**
- **Automatically at a Specific Time** - When you select this option, additional fields are presented for specifying the time at which agent updates will be initiated. The selection applies to the device's local time zone.

---

### Define All Local Domains

In the **LOCAL DOMAINS** text box, add any local (internal) domains/hostnames that should be resolved by the DNS server configured on the endpoint computer, instead of the DNS server selected by BCS Plus.
