

Using Postman for Barracuda Web Application Firewall APIs

<https://campus.barracuda.com/doc/95264038/>

Swagger REST APIs for the Barracuda Web Application Firewall are available on GitHub. See [Swagger APIs](#).

Perform the following steps to import Swagger files to Postman and run an API definition:

1. On GitHub, go to the [waf-automation](#) path, click **Code** and select **Download ZIP**. The waf-automation-master ZIP file gets downloaded.
2. Unzip the downloaded file, and go to **waf-automation-master\waf-automation-master\waf-api\openapi-spec\v11.0.0**.
3. Go to the **Postman** app and click **Import file** in the **Import an existing file** section on the **Home** page.
4. On the **Import** window, select the **Folder** tab and click **Choose folder from your computer**.
It is recommended to import one API or a maximum of 20 APIs at a time.
5. Select the **v3.2** folder from the **waf-automation-master\waf-automation-master\waf-api\openapi-spec\v11.0.0** and click **Import**.

6. All API definitions get imported to your Postman app and are displayed under **My Workspace > Collections**.
7. Search the API that you want to execute and click on it. The selected API definition gets loaded on the new tab.
8. Edit the values as required and save the definition to a new collection of your choice if you want to run the API definition for a later purpose.

Edit the domain of the APIs the first time you use them after the import.

For more information on Postman, see the Postman [Documentation](#).
