

How to Configure the Consistency Verification for Network Configurations

<https://campus.barracuda.com/doc/96026034/>

Integrity Check lets you select between different options for doing a logical test of the network configuration before it is activated.

This option is available only in **Advanced Configuration Mode**.

Step 1. Switch to Advanced Configuration Mode

1. Log into your firewall.
2. Go to **CONFIGURATION > Configuration Tree > Box > Network**.
3. In the left menu list, click **Configuration Mode** and select **Switch to Advanced**.

4. The left menu is now displayed in **Advanced Mode** and contains the list entry **Integrity Check**.

Step 2. Configure the Integrity Check

1. Click **Integrity Check** in the left menu list.

2. For **Consistency Verification**, select from the list:
 1. **Always** – Perform a consistency check after every configuration change.
 2. **Box-Only** – A consistency check is performed only on changes made on the box layer.
 3. **Never** – The consistency check is never performed.
3. For **Include Shared IPs**, select **yes** if you want to include shared IP addresses in the logical test.
