

How to Install Updates via SSH

<https://campus.barracuda.com/doc/98210680/>

In some cases, especially models with slower hardware or flash-based storage, it is recommended to reduce the load during the update by initiating the update via the command line.

Step 1. Download the Update from the Barracuda Download Portal

Go to the [Barracuda Networks download portal](#) and download the update or hotfix.

For more information, see [How to Download Applications, Updates, and Hotfixes](#).

Step 2. Update via SSH

1. Copy the update package or patch into the **/phion0/packages/** directory on your firewall or Control Center. The package path and file name must not contain whitespace characters.
2. In the Barracuda Firewall Admin SSH client, you can also transfer the file onto the system by changing to the **/phion0/packages/** directory and clicking **Send File**.
3. Type `phionUpdate /phion0/packages/packageName.tgz` where `packageName.tgz` is the name of the package the customer wants to install.

Wait for the update to finish. Depending on your system hardware, the upgrade can take anywhere from 10 minutes (on a fast system) to 60 minutes (on a flash unit). The Barracuda CloudGen Firewall will reboot after the upgrade process.

Do not interrupt the update. During this process, the system boots and disconnects several times. As soon as the system is successfully updated, the combined major, minor, and build number for the new version is displayed on the console. For example:

```
Barracuda CloudGen Firewall release 8.0.1-217
```

You can also log back into the system using SSH or Barracuda Firewall Admin. On the **Dashboard** page, you can confirm the system version and status.
